Paediatric Bone and Joint Infection Management

Purpose

This guideline aims to optimise the assessment, investigation and management of paediatric bone and joint infections.

Scope

This guideline provides information for all Queensland Health employees (permanent, temporary and casual) and all organisations and individuals acting as its agents (including Visiting Medical Officers and other partners, contractors, consultants and volunteers).

Guideline for management of paediatric bone and joint infections

Introduction

Acute haematogenous osteomyelitis (OM) and septic arthritis (SA) are serious conditions, may be life-threatening and can cause life-long disability. The goal of treatment is to prevent complications such as metastatic infection at other sites, persistent joint damage, growth disturbance or chronic OM. These infections are not uncommon diseases in childhood and may still pose diagnostic and treatment challenges.

Evidence Base: Literature review of treatment of paediatric bone and joint infection and expert group consensus.

1.1. Diagnosis

Acute

Consider bone or joint infection in any child who has one or more of the following:

- Limb pain
- Limb swelling, erythema
- Metaphyseal point tenderness
- Fever
- Limp/ pseudo paralysis of limb
- Babies with fever but no focal symptoms and no other cause.
  - Please note: may be apyrexial.

Differential diagnosis includes

- Soft tissue infection myositis, trauma, tumours, arthritis, autoimmune disorders.

Initial Investigations

- FBC
- CRP (+/- ESR)
- Blood culture
- X-ray (mandatory to exclude fracture, remember x-ray changes are a late sign).
  - Please note: Normal WCC, CRP, ESR does not exclude septic arthritis or osteomyelitis. However, if all are normal, acute osteomyelitis is highly unlikely. Subacute or chronic osteomyelitis should still be considered.
1.2 Treatment

Septic arthritis (SA)
- Requires urgent orthopaedic consultation.
- Will often require early incision and drainage.
- Intravenous antibiotics unless surgery planned within four (4) hours and systemically well.

Osteomyelitis (OM)
- Where a soft tissue collection or bone abscess is apparent radiologically, surgical drainage is recommended.
- If OM is diagnosed early by MRI scan and medical treatment is initiated successfully, surgical intervention is usually not required.
- If there is poor response to antibiotics after 48 to 72 hours, surgical drainage is indicated.
- There is currently no evidence of benefit for antibiotic impregnated beads in acute osteomyelitis. They may occasionally be inserted at the discretion of the treating consultant surgeon.
- Intravenous antibiotics should be administered immediately; unless surgery planned within four (4) hours and systemically well.
- Specimens in theatre: inoculate pus or joint fluid into:
  - Blood culture bottle; and
  - Neat fluid and/or tissue samples in universal container for microscopy and culture.

  Please note: Swabs for culture are less sensitive, tissue or fluid are preferred. Consider mycobacterial culture and tissue biopsy for histology if history of foreign travel, risk factors for tuberculosis (TB) or chronic history of limp/limb pain.
1.3 Antibiotics

1.3.1 Empiric
Start immediately unless surgical exploration imminent (within four (4) hours).

**Please note:** Risk of disseminated disease with rapid bony spread and septicaemia is high in young children.

</tbody>
</table>
1.5 Length of Treatment

1.5.1 Intravenous treatment initially (48 hours minimum)

- Short intravenous courses are effective when combined with continuing oral antibiotics in uncomplicated infection.

- Oral switch can be considered early after 48 hours if disease is uncomplicated and there is clinical improvement. Aim to change to oral when:
  - Clinical improvement
  - Afebrile at least 24 hours
  - Tolerating oral intake
  - CRP less than 20 or CRP decreased by more than \( \frac{2}{3} \) of highest value.

- Consider PICC line access for longer IV antibiotics course than 2 to 3 days in the following:
  - Complex disease with significant bone destruction
  - Neonates
  - Immunocompromised
  - Pseudomonas osteomyelitis
  - Relapsed infection, especially in setting of non-compliance
  - Persistent bacteraemia.
### 1.5.2 Oral (follow on treatment)

<tr>
<td>Salmonella sp (on ID advice only)</td>
<td>Oral Amoxicillin 30 mg/kg/dose (maximum 1 g/dose) three times a day or according to sensitivities based on ID advice.</td>
<td></td>
</tr>
</tbody>
</table>
1.5.3 Total length of treatment

Uncomplicated disease

The total duration of antibiotic therapy required to effect complete cure is unknown, but often clinical practice is based on consideration of reduction of old textbook regimes of up to 6 weeks therapy for both uncomplicated and complex disease. Historic observational studies suggested a risk of relapse with antibiotic therapy in OM of less than three weeks. More recently, experience in small populations with predominant MSSA and uncomplicated infection have shown good outcomes with 20 to 30 days total antibiotic therapy in OM and as little as 10 days in SA.\textsuperscript{5,6}

Sequential CRP determinations provide an excellent method for monitoring OM and SA. ESR falls more slowly.

- Recheck CRP, (+/- ESR) one week after commencing oral antibiotics and just prior to stopping.
- When CRP less than 20 (and ESR) and falling then stop antibiotics having completed a total of:
  - Acute OM: 3 to 4 weeks
  - SA: 2 to 3 weeks

Complicated disease

Where there is evidence of multifocal disease, vertebral or pelvic involvement, significant bone destruction, unusual pathogen, delayed or incomplete surgical drainage, delayed presentation or immunocompromised, the total duration of antibiotic therapy may be longer. This is managed on a case by case basis.

1.6 Clinical Management

- Children with suspected bone or joint infections should be admitted under orthopaedic team for assessment in the first instance.
- All children with bone and joint infections should be managed by Paediatric Orthopaedics and Paediatric ID.
- Long term intravenous antibiotic management should continue with Paediatric ID involvement.
- Outpatient follow-up during antibiotic course by Paediatric ID team.
Glossary of acronyms

CA-MRSA  Community acquired Methicillin-resistant Staphylococcus Aureus
CHQ@Home  Children’s Health Queensland Hospital In the Home Service
CRP  C-reactive protein
ESR  Erythrocyte sedimentation rate
FBC  Full blood count
Hib  Haemophilus influenzae type B
HITH  Hospital In The Home
ID  Infectious diseases
IMPS  Infection management and prevention service
MRI  Magnetic resonance imaging
nMRSA  Non-multiresistant methicillin-resistant Staphylococcus aureus
MRSA  Methicillin-resistant Staphylococcus aureus
MSSA  Methicillin sensitive Staphylococcus aureus
OM  Osteomyelitis
PICC  Percutaneous inserted central catheter
SA  Septic arthritis
TB  Tuberculosis
TDM  Therapeutic drug monitoring
