Purpose

This guideline provides best practice recommendations for the immediate assessment, management and follow-up of children who have sustained a community acquired needle stick injury. This guideline was developed in consultation with experienced Paediatric Infection Specialists.

Scope

This guideline provides information for all Children’s Health Queensland (CHQ) employees (permanent, temporary and casual) and all organisations and individuals acting as its agents (including Visiting Medical Officers and other partners, contractors, consultants and volunteers) caring for paediatric patients.

Guideline

Management of community needle stick injury (CNSI):

Presentations of children to Emergency Departments (ED) following accidental needle stick injury are not uncommon and such injuries may be a significant source of anxiety. It is important to note that CNSI in the common scenario of accidental exposure to needles found in parks etc. are of very low risk of blood borne virus (BBV) transmission, with cases of BBV transmission by such CNSI not being documented in Australia.

Key aspects of the management of CNSI are:

- First aid
- Assessing injury
- Confirming low BBV transmission risk (most CNSI)
- Assessing and managing Tetanus and Hepatitis B immunity status
- Organising follow up serology and reassurance
- HIV post-exposure prophylaxis (PEP) is only a consideration in exceptional circumstances with higher risk exposures.

Recommendations are contained in the flow chart and notes below. The Infection Management and Prevention Service (IMPS) are available for advice on the management of a child with CNSI, the (unlikely) need for PEP and to discuss follow-up (contact via Queensland Children’s Hospital (QCH) Switchboard).

PEP, if required, should be prescribed as soon as possible after the exposure and within 72 hours. A separate and linked guideline provides information on HIV PEP, which may be recommended in discussion with IMPS in very high risk non-occupational BBV exposures.
COMMUNITY NEEDLE STICK INJURY

FIRST AID
Allow to bleed (if applicable)
Wash with soap and water

HISTORY AND RISK ASSESSMENT
Details of injury
Source status if known (Section 1)

CONFIRM
LOW RISK FOR BBV
(Section 1 and Table 1)

IF NOT LOW RISK:
- Discuss HIV PEP with IMPS (Note: rare for CNSI to be not low risk).
- HBIG will be indicated unless documented immunity.

ASSESS TETANUS IMMUNISATION STATUS
Tetanus immunisation (TIG) (Table 2)

ASSESS HEPATITIS B IMMUNITY
(Section 2)
Establish immunisation history.

Request baseline serology: Hepatitis B (HBsAb (urgent), HBsAg) and (if not low risk) Hepatitis C & HIV
HBsAb result: unless immunity previously documented, request urgently (within 72 hrs) to allow for immunisation if indicated.

HEPATITIS B IMMUNE STATUS?

Hepatitis B immunised
Organise for HBsAb result review and patient recall by ED for HBIG/HBV vaccine if indicated and for baseline serology results to be communicated

HBsAb less than 10 IU/mL (Section 3)
Low risk exposure: HBV vaccine as soon as possible (but within one week).
High risk exposure: HBIG (within 72 hours) and HBV vaccine
Hepatitis B immune: Fully immunised and HBsAb more than or equal to 10 IU/L previously or on current test. No further action regarding Hepatitis B immunisation.

FOLLOW UP
For low risk exposures refer to LMO for follow up testing – HIV, Hepatitis C and B (if initially non-immune) serology at 3 months post exposure (this guideline can be provided to GPs).
Section 1. Assessment of CNSI

Details of injury (CNSI)

Mechanism: e.g. accidentally picking up needle, stepping on needle, stuck by another person, unwitnessed injury and child too young to tell.

Exposure type: e.g. hollow bore needle, syringe barrel attached / not attached, gauge of needle.

Location: e.g. park, beach, back alley, home, others.

Disposal: if the discarded needle(s) still need(s) to be removed from a public area, call the Clean Needle Helpline on 1800 633 353 to arrange for proper disposal.

Source

The status of the source is generally not known in the common scenario of injury by discarded needles occurring in a public area. In Australia, the level of HIV infection in injecting drug users is below 3% and HIV incidence (percentage of new people infected each year) is low - below 1%.1 Where the source is known to have a BBV, discuss injury with QCH IMPS.

Risk assessment

The risk of acquiring BBV infection from discarded injecting equipment is extremely low. No cases of HIV infection in Australia have ever been identified due to discarded injecting equipment2 (Table 1). Almost all CNSI can be managed as low risk for BBV transmission following exclusion of risk factors of concern.

Examples of factors of concern for possible increased risk of BBV transmission (discuss with IMPS):

- Device visibly contaminated with blood
- Needle directly placed into artery or vein
- Source known to have HIV/Hep B/C infection
- Deep injury / injection with a hollow bore needle.3
- Sharing of needles to inject drugs
- Assault / inflicted injury with a needle

HIV is a fragile virus outside the body, especially when exposed to unfavourable external environmental conditions. The blood volume in discarded needles is likely to be less than that associated with exposures in the health care settings.4
Table 1. Risk assessment for transmission of Blood Borne Viruses (BBV)* following CNSI

<th>Community Acquired NSI</th>
</tr>
</thead>
<tbody>
<tr>
<td>NSI in health care worker (source status known)</td>
<td>When the origin of needle is known - data from needle sharing in injecting drug users of unknown status (^{(1)})</td>
</tr>
<tr>
<td><strong>Hep B</strong></td>
<td>Up to 30% if source is HepBag +ve</td>
</tr>
<tr>
<td><strong>Hep C</strong></td>
<td>1.8% (range 0 - 7%) if source Hep C RNA +ve</td>
</tr>
<tr>
<td><strong>HIV</strong></td>
<td>~ 0.3% if source known to be HIV +ve ****</td>
</tr>
</tbody>
</table>

* BBV are viruses transmissible by significant exposure to contaminated bodily fluids and identifiable by current conventional laboratory methods e.g. Hep B, Hep C and HIV

** Most likely scenario presenting to Emergency Department

*** Results based on an prevalence of ~65% and <3% of HCV and HIV infections respectively in IDU’s in Australia, and a carrier rate of 80% and 100% for HCV and HIV respectively. \(^{(1)}\)

**** If the blood on the outside and inside surfaces of the needle has dried the risk of HIV transmission is probably lower than 0.3% since the concentration of HIV diminishes by 90-99% within several hours after drying and continues to decrease gradually thereafter. \(9,10\)

**Section 2. Serology**

- Obtain verbal consent and provide pre-test counselling. Pre- and post-test counselling are important with respect to HIV and Hepatitis. A positive baseline test for HIV, Hepatitis B or C may indicate that the child has acquired the infection by mother to child transmission.

- Request (baseline) Hepatitis B (HBsAb & HBsAg) serology. Request in addition Hepatitis C and HIV baseline serology if not low risk exposure; **these are not required for low risk exposures.**

- Mark HBsAb “URGENT” and request laboratory staff to ring result through to ED.

- HBV serology is performed daily. On weekends and public holidays serology may be performed on next working day; this will generally be able to provide the result to action within 72 hours of exposure. If a long weekend, contact laboratory and discuss availability of earlier testing. Where this guideline is being used outside of QCH, please confirm testing arrangements with relevant pathology provider

- Do not send the needle or syringe for testing, as results on discarded injecting equipment are unreliable (and not generally performed by diagnostic laboratories).
Section 3. Hepatitis B immunisation

HBIG – to obtain at QCH call Blood Bank on (07) 3068 3555.

- Administer within 72 hours of injury (by intramuscular (IM) injection)
- Recommended schedule:
  - Up to 30 kg 100 international units (IU)
  - More than 30 kg 400 international units (IU)
  
  **Note:** HBIG comes in vials of 100 IU and 400 IU (concentration is approximately 100 IU per mL).

- HBIG can be given and HBV vaccination commenced as soon as possible, but up to 7 days after exposure (Note: Limited evidence for efficacy for later treatment – early treatment preferred).

**Hepatitis B vaccine (IM)**
- For all less than 20 year old: Paediatric Engerix® B® (10 microgram) 0.5 mL at 0, 1 and 6 months.
- **Alternative for 11 to 15 year olds (only):** Adult Engerix® B® (20 microgram) 0.5 mL at 0 and 6 months.
- Arrange appropriate follow up with local medical provider (e.g. GP).
- Hepatitis B vaccine repeated at 1 (if required; see above) and 6 months after 1st dose.
- Repeat serology Hep B (HBsAb & HBsAg), Hep C antibody and HIV antibody at 3 months.

Section 4. HIV post exposure prophylaxis

If due to exceptional circumstances, HIV PEP may be appropriate, see [CHQ-GDL-65664 Paediatric Guideline: Post-Exposure Prophylaxis for HIV](#) and contact QCH Infectious Diseases via QCH switchboard (07) 3068 1111 to discuss.
Section 5. Management of Tetanus immunisation status

Needle stick injuries are regarded as ‘tetanus prone wounds’.

For full details on management of tetanus immunisation, please refer to the Australian Immunisation Handbook.
