RECOMMENDATIONS FOR CLINICAL CARE GUIDELINES ON THE MANAGEMENT OF OTITIS MEDIA in Aboriginal and Torres Strait Islander Populations

updated 2010
These Guidelines have been prepared following consultation with experts in the field of ear and hearing health and are based on information available at the time of their preparation. Practitioners should have regard to any information on these matters which may become available subsequent to the preparation of these guidelines.

The Commonwealth does not accept any contractual, tortious or other liability whatsoever in respect of their contents or any consequences arising from their use. While all advice and recommendations are made in good faith, the Commonwealth does not accept legal liability or responsibility for such advice or recommendations.

Recommendations for Clinical Care Guidelines on the Management of Otitis Media in Aboriginal & Torres Strait Islander Populations (April 2010)

CONTENTS

Information to assist primary health care providers in the delivery of comprehensive, effective and appropriate care for Aboriginal and Torres Strait Islander people with otitis media (ear infections).

USING THE RECOMMENDATIONS FOR CLINICAL CARE GUIDELINES ON OTITIS MEDIA iii

DEFINITIONS AND ABBREVIATIONS viii

PRACTICAL TREATMENT PLANS xii

SECTION A: PREVENTION OF OTITIS MEDIA AND HEARING LOSS

Prevent the occurrence of otitis media and hearing loss in Aboriginal and Torres Strait Islander children 1

SECTION B: DIAGNOSIS OF OTITIS MEDIA

Facilitate early detection of persistent otitis media and associated hearing loss to avoid possible adverse effects 5

SECTION C: PROGNOSIS

Improve family understanding of the likely outcomes of illness to raise awareness and avoid possible adverse effects of persistent otitis media and persistent hearing loss 9

SECTION D: MEDICAL MANAGEMENT OF OTITIS MEDIA

Facilitate resolution or prevent progression of otitis media and hearing loss to minimise possible adverse effects 13
**SECTION E: AUDIOLOGICAL ASSESSMENT AND MANAGEMENT**

Enhance hearing, communication and access to relevant information .................................................. 25

**SECTION F-1: PRACTICAL CONSIDERATIONS IN HEALTH CARE DELIVERY**

Address implementation issues and barriers to ensure effective, high quality care for all clients .................................................. 31

**SECTION F-2: PRIORITISATION OF PRIMARY HEALTH CARE SERVICES IN DIFFERENT SETTINGS**

When resources are limited, focus on those most likely to benefit from the recommendations contained within this document. Develop a health care strategy for your organisation. The strategy should cover prevention, diagnosis and management ................................................................. 35

**METHODS USED IN DEVELOPING THE GUIDELINES** ............ 43

**REFERENCES** ................................................................................................................................. 45

**ALGORITHMS** ............................................................................................................................... 52

**KEY MESSAGES FOR PRIMARY HEALTH CARE PROVIDERS** ................................................. 60
The original ‘Recommendations for Clinical Care Guidelines on the Management of Otitis Media’ were directly linked to the Systematic Review of Existing Evidence and Primary Care Guidelines on the Management of Otitis Media in Aboriginal and Torres Strait Islander Populations (March 2001). This updated version is based on the 2001 Guidelines and relevant research studies published since 2001. It results from a synthesis of information derived from a process of explicit searching of the medical literature and critical appraisal. The literature search was last updated on the 1st April 2010. Recommendations in each of the sections are grouped according to their clinical relevance.

Our intended users are health care professionals who work with Aboriginal and Torres Strait Islander populations. This includes Aboriginal Health Workers, Aboriginal ear health workers, primary care and specialist physicians, nurses, remote area nurses and nurse practitioners, audiologists, audiometrists, speech therapists, and child development specialists (including Advisory Visiting Teachers and Teachers of the Deaf). Aboriginal and Torres Strait Islander health staff working with Aboriginal and Torres Strait Islander families are likely to have the greatest impact on severe otitis media. The guidelines are also suitable to be adopted for use in local clinical practice guidelines and standard treatment protocols (e.g. Central Australian Rural Practitioners Association Standard Treatment Manual, Queensland Primary Clinical Care Manual etc).

Otitis media (OM) refers to inflammation and infection of the middle ear space. It is a complex condition associated with both illness and hearing loss. It is best to regard OM as a spectrum of disease that ranges from mild (otitis media with effusion, OME) to severe (chronic suppurative otitis media, CSOM). In all populations, every child will experience episodic OME (fluid behind the tympanic membrane) at some time. Nearly all children will experience at least one episode of acute otitis media (AOM). In developed countries, most children will improve spontaneously. Concerns about OM arise in children who suffer frequent episodic AOM or persistent OME. This is usually a problem in the first 6 years of life (with spontaneous resolution more likely in older children). Children who develop CSOM (the most severe form of OM) are most likely to suffer problems as adults. Unfortunately, for some of these affected individuals, OM (and its associated hearing loss) is a lifelong problem.

OM causes conductive hearing loss (CHL). Episodic OME and AOM can cause a mild hearing loss while there is fluid in the middle ear space. Chronic disease (persistent OME and CSOM) can cause moderate hearing loss. Additionally, the hearing loss can fluctuate depending on the health of the middle ear. CHL is often regarded as a temporary condition because its causes are generally amenable to medical or surgical treatment. However, it will be a chronic problem in chronically diseased ears. In addition, sensorineural hearing loss can occur secondary to long-term chronic OM.
The target populations for these recommendations are Aboriginal and Torres Strait Islander Australians. While OM is a common illness in all populations, Indigenous Australians have the highest rates of severe and persistent OM described in the medical literature. In some areas (generally rural and remote Indigenous communities), the clinical course of OM is characterised by early age of onset and high prevalence of severe disease. This is quite different from the clinical course described in most well-designed studies involving other children (where spontaneous resolution of disease is common). This high natural cure rate has meant that intervention studies are limited in their ability to detect sustained clinical improvement over time. For children at high risk of CSOM, we recommend interventions where there is strong evidence of short-term benefit even if the long-term benefits were less clear.

Each recommendation has been explicitly linked to the source of the original relevant evidence (type and level) and any evidence-based guidelines that have made the same recommendation. Two main information sources of information have been used: i) evidence-based clinical practice guidelines, evidence summaries, and systematic reviews, and ii) high quality primary research on OM and hearing loss. While the recommendations have been based on the best available evidence, their applicability will also be dependent on local factors. Most important are the personal preferences of the affected individuals, and the local resources available to assist in the management of OM. These local factors should always be considered when developing an ear health program and when advising families about their management options. In some cases, strict adherence to the guidelines will not be appropriate.

Most of the recommendations were regarded as interventions and classified according to the levels of evidence for Prevention, Management and Health Care Delivery shown in Table 2. Additional tables describing levels of evidence for diagnostic accuracy studies and prognosis studies have been included for the relevant sections (see Tables 4 and 5). Recommendations are also linked to any other available evidence-based clinical practice guidelines that addressed the same issue. The criteria used for identifying clinical practice guidelines that have a high likelihood of scientific validity are shown in Table 6.

Overall, we identified 51 evidence-based guidelines, reviews and summaries: 12 evidence-based guidelines, 10 clinical evidence reports, 1 evidence-based text-book, 21 Cochrane Systematic Reviews, and 7 other systematic reviews. Nearly all of these were new publications. There are likely to be other evidence-based documents in the grey literature that we were not able to identify with our search strategy.
Grading of Recommendations According to NHMRC\textsuperscript{12} (Table 1)

Each recommendation has been graded according to the most recent National Health and Medical Research Council (NHMRC) grading system 2010.\textsuperscript{12} Grade A recommendations are based on several level I or II studies with low risk of bias where all studies show consistent results. Grade A recommendations are applicable to the Australian health care context. Grade B recommendations are based on one or two level II studies with low risk of bias or a systematic review of level III studies with low risk of bias. In addition, the results of most of the studies are consistent. Grade B recommendations are applicable to the Australian health care context with few caveats. Grade C recommendations are based on Level III studies with low risk of bias or level I or level II studies with moderate risk of bias. For Grade C recommendations, some inconsistencies reflect genuine uncertainty around the clinical question. Grade C recommendations are probably applicable to the Australian health care context with some caveats. Grade D recommendations are based on level IV studies or level I, II and III studies with high risk of bias. Grade D recommendations should be applied cautiously in the Australian health care context.
### TABLE 1. NHMRC Grade of Recommendations

<table>
<thead>
<tr>
<th>Grade of Recommendation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Body of evidence can be trusted to guide practice.</td>
</tr>
<tr>
<td>B</td>
<td>Body of evidence can be trusted to guide practice in most situations.</td>
</tr>
<tr>
<td>C</td>
<td>Body of evidence provides some support for recommendation but care should be taken in its application.</td>
</tr>
<tr>
<td>D</td>
<td>Body of evidence is weak and recommendation must be applied with caution.</td>
</tr>
<tr>
<td>GPP</td>
<td>No reliable evidence exists directly addressing the impact of the recommendation. The recommendation (a Good Practice Point) reflects the consensus view of the multidisciplinary guidelines group and is based on clinical experience.</td>

</tbody>
</table>
DEFINITIONS AND ABBREVIATIONS

Otitis Media Terms:

**Otitis Media (OM):** Refers to all forms of inflammation and infection of the middle ear. Active inflammation or infection is nearly always associated with a middle ear effusion (fluid in the middle ear space).

**Otitis Media with Effusion (OME):** Presence of fluid behind the eardrum without any acute symptoms. Other terms have also been used to describe OME (including ‘glue ear’, ‘serous otitis media’ and ‘secretory otitis media’). OME may be episodic or persistent. A type B tympanogram or reduced mobility of the eardrum on pneumatic otoscopy are the most reliable indicators of OME.

**Persistent (Chronic) Otitis Media with Effusion:** Presence of fluid in the middle ear for more than 3 months without any symptoms or signs of inflammation.

**Acute Otitis Media (AOM):** General term for both acute otitis media without perforation and acute otitis media with perforation. It is defined as the presence of fluid behind the eardrum plus at least one of the following: bulging eardrum, red eardrum, recent discharge of pus, fever, ear pain or irritability. A bulging eardrum, recent discharge of pus, and ear pain are the most reliable indicators of AOM.

**Acute Otitis Media without Perforation (AOMwoP):** The presence of fluid behind the eardrum plus at least one of the following: bulging eardrum, red eardrum, fever, ear pain or irritability. A bulging eardrum and/or ear pain are the most reliable indicators of AOMwoP.

**Acute Otitis Media with Perforation (AOMwiP):** Discharge of pus through a perforation (hole) in the eardrum within the last 6 weeks. The perforation is usually very small (a pinhole) when the eardrum first ruptures. The perforation can heal and re-perforate after the initial onset of AOMwiP.

**Recurrent Acute Otitis Media (rAOM):** The occurrence of 3 or more episodes of AOM in a 6 month period, or occurrence of 4 or more episodes in the last 12 months.

**Chronic Suppurative Otitis Media (CSOM):** Persistent ear discharge through a persistent perforation (hole) in the eardrum. Definition of CSOM varies in the duration of persistent ear discharge (from 2 weeks to 12 weeks). Importantly, the diagnosis of CSOM is only appropriate if the tympanic membrane perforation is seen and if it is large enough to allow the discharge to flow out of the middle ear space.

**Dry Perforation:** Presence of a perforation (hole) in the eardrum without any signs of discharge or fluid behind the eardrum. Some people also refer to this as inactive CSOM.

**Otitis Externa:** Infection of the ear canal associated with pain, swelling and discharge. Other terms have also been used to describe otitis externa (including ‘tropical ear’ and ‘swimmers’ ear’). This is not a form of OM.

**Population at High-risk of Persistent (Chronic) OME:** In this document, children living with recognised OM risk factors are considered to be a high risk population for persistent OME. The most important risk factors are strong family history for OM, attending child care, frequent exposure to other children, and being of Aboriginal and/or Torres Strait Islander descent.
Population at High-risk of CSOM: In this document, populations with a prevalence rate of CSOM of greater than 4% are described as high-risk for CSOM. This will apply to most rural and remote Aboriginal communities where persistent disease and chronic perforation of the eardrum are common. The World Health Organization has recommended that rates higher than 4% are unacceptable and represent a massive public health problem.

Surveillance for Otitis Media: The systematic and ongoing collection, analysis and interpretation of measures of middle ear disease and hearing loss in order to identify and correct deviations from normal.

Screening for Otitis Media: Any measurement (completed at a single point in time) that aims to identify individuals who could potentially benefit from an intervention for OM. This may include the use of symptoms, signs, laboratory tests, or risk scores for the detection of existing or future middle ear disease.

Otoscopy: Looking in the ear with a bright light to identify features associated with outer or middle ear disease. This is sometimes referred to as ‘simple otoscopy’.

Pneumatic Otoscopy: The combination of simple otoscopy with the observation of eardrum movement when air is blown into the ear canal. Pneumatic otoscopy is able to determine mobility of the eardrum. Reduced mobility of an intact eardrum is a good indication of the presence of middle ear fluid.

Video Otoscopy: Observing the eardrum via a small camera placed in the ear canal. The image is displayed on a screen. Video pneumatic otoscopy (including images of eardrum mobility) is also possible.

Tympanometry: An electro-acoustic measurement of the stiffness, mass and resistance of the middle ear (more simply described as mobility of the eardrum). This test can be used to describe normal or abnormal middle ear function.

Acoustic Reflectometry: A simple, painless and non invasive diagnostic tool for detecting middle ear effusion. It performs spectral gradient analysis of sound reflected off the eardrum. This is often a less sensitive and specific test than pneumatic otoscopy or tympanometry. It has the advantage that it is easy to perform in uncooperative children.

Grommet (Tympanostomy Tube): A small tube surgically placed across the eardrum to re-establish ventilation to the middle ear. It is also called a ‘ventilation tube’, a ‘PE tube’ (pressure equalisation tube), or a ‘tympanostomy tube’.

Insufflation: Blowing air into the ear to determine the mobility of the eardrum. This is done as part of pneumatic otoscopy.

Mastoiditis: Infection of the mastoid air cells of the mastoid bone (behind the middle ear).

Attic Perforation: This is a perforation in the superior part of the eardrum. A perforation in this location may be associated with a deep retraction pocket or cholesteatoma.

Myringotomy: A surgical incision in the eardrum to drain fluid.

Myringoplasty: A surgical operation to repair a damaged eardrum.

Tympanocentesis: The insertion of a needle through the tympanic membrane in order to aspirate fluid from the middle ear space.

Tympanoplasty: A surgical operation to correct damage to the middle ear and restore the integrity of the eardrum and bones of the middle ear.

Adenoidectomy: A surgical operation to remove the adenoid tissue at the back of the nose (near the tonsils).

Mastoidectomy: A surgical operation to remove infected mastoid air cells in the mastoid bone.
Audiological Terms:

**Hearing loss:** Any hearing threshold response outside the normal range that is detected by audiometry. It can be at any test frequency in either ear.

**Conductive Hearing Loss (CHL):** Hearing loss that results from dysfunction of the outer or middle ear that interferes with the efficient transfer of sound to the inner ear. It is characterised by a loss in sound intensity.

**Sensorineural Hearing Loss:** Hearing loss that results from dysfunction in the inner ear (especially the cochlea). This is where sound vibrations are converted into neural signals. This type of hearing loss may also occur secondary to dysfunction of any part of the auditory nerve.

**Fluctuating Hearing Loss:** Hearing loss that changes significantly over time. This results in inconsistent auditory input. CHL is often associated with fluctuations related to changes in the OM condition.

**Screening for Hearing Loss:** Any measurement (completed at a single point in time) that aims to identify individuals who could potentially benefit from an intervention for hearing loss. This may include the use of risk factors, symptoms, signs, electro-acoustic tests or behavioural tests for the detection of existing or future hearing loss.

**Universal Neonatal Hearing Screening:** The use of objective audiometric tests to identify neonates who might have significant congenital hearing loss.

**Audiometry (Hearing Assessment):** The testing of a person’s ability to hear various acoustic stimuli.

**Pure-tone Audiometry:** The assessment of hearing sensitivity for pure-tone stimuli in each ear. This is done using headphones (air conduction) or via bone conductors (bone conduction). Testing is possible from around 3 years of age.

**Visual Reinforcement Audiometry:** A technique that enables assessment of hearing sensitivity in young children from around 6 months to 3 years of age. This testing does not allow the testing of each ear individually.

**Hearing Loss in a Population:** The number of children who have abnormal hearing. Hearing loss may affect one ear (unilateral) or affect both ears (bilateral).

**Hearing Impairment Classification:** A categorisation that describes the degree of disability associated with hearing loss in the better ear. Hearing impairment classification applies a graded scale of mild, moderate, severe and profound. This is based on degree of deviation from normal thresholds in the ‘better ear’ as recorded through audiometry. It is typically calculated as a 3 frequency average (3FA) of the threshold of hearing (in dBHL) at 500Hz, 1000Hz and 2000Hz. However, hearing loss associated with OM can vary in severity over time and have a substantial effect upon hearing for frequencies outside those routinely tested. In addition, this classification is based on pure tone audiometry on the day of the test. It does not account for the impact of early onset, language, processing ability and environmental factors. Hence, average hearing levels based upon a single assessment could underestimate the degree of impairment.
Grades of Hearing Impairment*:

<table>
<thead>
<tr>
<th>Grade of Impairment</th>

</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>No Hearing Loss 20dB or better (better ear)</td>
</tr>
<tr>
<td>1</td>
<td>Mild Hearing Loss 21-45dB (better ear)</td>
</tr>
<tr>
<td>2</td>
<td>Moderate Hearing Loss 46-65dB (better ear)</td>
</tr>
<tr>
<td>3</td>
<td>Severe Hearing Loss 66-90dB (better ear)</td>
</tr>
<tr>
<td>4</td>
<td>Profound Hearing Loss 91dB or greater (better ear)</td>
</tr>
</tbody>
</table>

*These categories may not be appropriate for young children speaking English as a second language. Refer to section E for more information about signs, consequences and recommendations of hearing impairment.

Any child with permanent or long term (more than 3 months) bilateral hearing loss greater than 20dB in the better ear should be referred to an audiologist for evaluation of hearing and communication needs. This will include consideration of suitability for personal amplification or assistive devices. In the first instance, referral would be made to state or territory funded audiological services where available. Referral to an ENT surgeon and/or paediatrician can be made at the same time.

Health Care Terms:

**Primary Health Care**: Primary health care is a practical approach to maintaining health and making essential health care universally accessible to individuals and their families. Primary health care happens in local communities in a manner acceptable to the local community and with their full participation. Primary health care is more than an extension of basic health services and has social and developmental dimensions.

**Audiologist**: An allied health practitioner responsible for the diagnosis and non-medical management of hearing loss and related verbal communication difficulties. Their responsibilities include provision of hearing aids and devices, and auditory training.

**Speech Pathologist**: An allied health practitioner responsible for the diagnosis and non-medical management of speech or language delays/disorders. Their responsibilities include provision of speech therapy.

**ENT Surgeon**: A medical specialist trained in advanced diagnostic, medical and surgical interventions for pathologies of the ears, nose and throat.

Other Related Terms:

**Aboriginal or Torres Strait Islander**: “A person of Aboriginal or Torres Strait Islander descent who identifies as an Aboriginal or Torres Strait Islander and is accepted as such by the Aboriginal or Torres Strait Islander community in which he (she) lives”.

**Good Practice Point (GPP)**: This recommendation has been applied where no reliable evidence exists directly assessing the impact of the recommendation. The recommendation reflects the consensus of the multidisciplinary guidelines group and is based on clinical experience.
# PRACTICAL TREATMENT PLANS

A summary of practical treatment plans for the management of childhood otitis media in populations at high risk of CSOM

<table>
<thead>
<tr>
<th>DIAGNOSIS</th>
<th>MANAGEMENT</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>1. Aerated Middle Ear (Normal)</strong></td>
<td>1. <strong>Family Education:</strong> Discuss the normal language development milestones and the importance of going to the health centre if their child develops ear discharge.</td>
</tr>
<tr>
<td><strong>2. Episodic OME</strong></td>
<td><strong>Fluid in middle ear without symptoms.</strong> 1. <strong>Family Education:</strong> Advise the family about the likely hearing loss (usually around 25dB) and the need to re-examine the child in 3 months time (see chronic OME below). Discuss the normal language development milestones and the importance of going to the health centre if their child develops ear discharge.</td>
</tr>
<tr>
<td><strong>3. Persistent OME</strong></td>
<td><strong>Fluid in the middle ear without any symptoms for greater than 3 months.</strong> 1. <strong>Family Education:</strong> Advise the family about the likely hearing loss (usually around 25dB) and the need to organise a hearing test if chronic ear disease affects both ears. Treatment will be determined by the level of hearing loss in the better hearing ear. Discuss the normal language development milestones and the importance of going to the health centre if their child develops ear discharge. 2. <strong>Medical:</strong> Review every 3 months. Recommend referral for grommet surgery if OME persists for &gt;3months and hearing loss &gt;35dB, or if severe retraction of the eardrum is present (i.e. retraction pocket or atelectasis). 3. <strong>Audiological:</strong> Monitor for delay in language development. If hearing loss is 20-35dB, the child will benefit from classroom sound-field amplification and enhanced communication strategies (e.g. get close, speak clearly, check understanding etc). If hearing loss &gt;35dB, also refer for hearing aids.</td>
</tr>
<tr>
<td><strong>4. AOMwoP (Acute Otitis Media)</strong></td>
<td>1. <strong>Family Education:</strong> Emphasise the need for adherence to antibiotics to prevent CSOM. Advise the family about the likely hearing loss (usually around 25dB). Discuss the normal language development milestones and the importance of going to the health centre if their child develops ear discharge. 2. <strong>Medical:</strong> Recommend at least 7 days amoxycillin (50mg/kg/day). Review at 4-7 days. If bulging persists, continue for further 7 days (90mg/kg/day). [If AOM associated with diarrhoea or pneumonia can use daily IM procaine penicillin 50mg/kg/day until clinically improved, then complete course with amoxycillin. If AOM associated with trachoma, can use single dose of 30mg/kg azithromycin. It should be noted that azithromycin is not currently licensed for use in children under six months of age].</td>
</tr>
</tbody>
</table>
### 5. AOMwIP
**Discharge through a perforation.**

1. **Family Education:** Emphasise the need to take medications as prescribed to prevent CSOM. Advise the family about the likely hearing loss (usually around 35dB). Discuss the normal language development milestones and the importance of going to the health centre if the ear discharge does not improve.

2. **Medical:** Recommend 14 days amoxycillin (50-90mg/kg/day). Review at 4-7 days, and again at 10-14 days. Continue antibiotics until discharge and eardrum bulging has resolved. [If AOM with perforation associated with diarrhoea or pneumonia can use daily IM procaine penicillin as above.]

   Persistent perforation despite amoxycillin 90mg/kg/day: change to amoxycillin-clavulanate (90mg/kg/day) for further 14-28 days and introduce cleaning of discharge followed by ciprofloxacin ear drops (2-5 drops 2-4 times a day). Continue to review weekly. [If child develops diarrhoea or pneumonia can use daily IM procaine penicillin 100mg/kg/day until clinically improved, then complete course with oral antibiotics.]

### 6. Recurrent AOM
**3 or more episodes of AOM in the previous 6 months or 4 or more episodes in the last 12 months.**

1. **Family Education:** Emphasise the need to take medications as prescribed. Discuss the normal language development milestones and the importance of going to the health centre if their child develops ear discharge.

2. **Medical:** Families of infants should be given the option of treatment with daily amoxycillin for a period of 3-6 months (25-50mg/kg 1-2 times daily). This will reduce further episodes of AOM by about 50% and risk of perforation by about 40%.

### 7. CSOM
**Persistent discharge with an easily visible TM perforation.**

1. **Family Education:** Emphasise the need to take medications as prescribed and that treatment may need to continue for a long time. Explain that only profuse discharge will be visible outside of the ear canal. Discuss the normal language development milestones and the importance of going to the health centre if the ear discharge gets worse.

2. **Medical:** Clean the ear canal with dry mopping, syringing or suction. Dry and add ciprofloxacin eardrops (2-5 drops 2-4 times a day). Continue until ear has been dry >3 days. Review 1-2 times weekly. Prolonged periods of the treatment may be necessary. Treatment is successful in up to 50% of children in some remote settings. If no improvement despite good compliance, consider admission to hospital for IV antibiotic treatment.

3. **Audiological:** Hearing loss usually around 35dB. Monitor for delay in language development. If hearing loss is 20-35dB the child will benefit from classroom sound-field amplification and enhanced communication strategies. If hearing loss >35dB, also refer for hearing aids.
### 8. Dry Perforation
*Perforation without any discharge for less than 3 months.*

1. **Family Education:** Advise the family about the likely hearing loss (varies from normal if perforation small to >40dB if very large) and the need to re-examine the child in 3 months time (see chronic dry perforation below). Discuss the normal language development milestones and the importance of presenting early to the health centre if their child develops ear discharge.

### 9. Chronic Dry Perforation
*Perforation without any signs of discharge for greater than 3 months.*

1. **Family Education:** Advise the family about the likely hearing loss (varies from normal if perforation small to >40dB if very large) and the need to organise a hearing test. Treatment will be influenced by the level of hearing loss in the better hearing ear. Discuss the normal language development milestones and the importance of going to the health centre if the child develops ear discharge.

2. **Medical:** If hearing loss >35dB or having frequent infections with discharge, refer to ENT surgeon for consideration of eardrum repair.

3. **Audiological:** Monitor for delay in language development. If hearing loss is 20-35dB, the child will benefit from classroom sound-field amplification and enhanced communication strategies. If hearing loss >35dB, refer for hearing aids.
SECTION A: PREVENTION OF OTITIS MEDIA AND HEARING LOSS

Prevent the occurrence of otitis media and hearing loss in Aboriginal and Torres Strait Islander children

<td>IV5</td>
<td>IB23</td>
</tr>
</tbody>
</table>

*GPP = Good Practice Point
### Encourage Early Interventions

- Some features of OM (such as ear pain) may be absent, and that regular health centre attendance for ear examinations is recommended.  
  - IV\(^62,65,66\)  
  - I^aB\(^23\)

- All forms of OM are associated with some degree of hearing loss.  
  - IV\(^8\)  
  - I^aA\(^15\)

- Hearing loss can affect the development of speech and language skills. Additional language stimulation is very important for normal language development.  
  - IV\(^67,69\)  
  - I^aA\(^14\)  
  - I^aB\(^23\)

- (If applicable) certain babies are at high risk for development of OM and its consequences (e.g. those with cleft palate and other craniofacial abnormalities, foetal alcohol syndrome, fragile X syndrome, Down syndrome).  
  - IV\(^28\)  
  - I^aA\(^16,17,19\)

### Breast Feeding

GPP: Encourage mothers to continue breast feeding for at least 6 months to reduce the risk of OM.  
  - IV\(^25,26,55,70\)  
  - I^aA\(^15,16,18\)

### Personal Hygiene

GPP: The health practitioner should tell families or caregivers that nasal discharge carries germs (viruses and bacteria) which are responsible for OM. Children should wash and dry their hands after blowing their noses or coughing. Children’s faces and hands should be kept clean of nasal discharge. Frequent hand washing is also recommended.  
  - IV\(^5,39,71,73\)  
  - I^aA\(^16\)  
  - I^aB\(^23\)

### Vaccination

**Grade A:** Give pneumococcal conjugate vaccination during infancy according to local immunisation schedule to reduce AOM, rAOM and the need for surgery.  
  - 17:74-78;5,29  
  - I^aA\(^16\)

**Grade B:** Give influenza vaccination according to local immunisation schedule. This may be beneficial if given just before the flu season.  
  - 36:79;58:5,29  
  - I^aA\(^16\)

### Pacifier

**Grade B:** Tell the families/caregivers that the use of a pacifier (dummy) after 6 months of age can increase the risk of OM.  
  - 26:25;28;55,87  
  - I^aA\(^15,16,19\)
| **Swimming** | **Grade D**: Swimming should not be discouraged routinely.  
If swimming is known to be associated with new or persistent ear infections in an individual, it is reasonable to recommend keeping the ear dry. |  |  |
| **Smoking** | **GPP**: Strongly discourage people from smoking around children. |  |  |
| **Bottle Feeding** | **GPP**: Tell the families/caregivers that if the child is bottle-fed, the upright position is recommended. |  |  |
### SECTION B: DIAGNOSIS OF OTITIS MEDIA

Facilitate early detection of persistent otitis media and associated hearing loss to avoid possible adverse effects

<table>
<thead>
<tr>
<th>STRATEGY</th>
<th>RECOMMENDATION AND GRADING</th>
<th>EVIDENCE STUDIES</th>
<th>EVIDENCE-BASED GUIDELINES</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Otitis Media Surveillance</strong></td>
<td>GPP: Ear examination for OM should be part of the clinical assessment of children.</td>
<td>IV\textsuperscript{29,31}</td>
<td>I~A\textsuperscript{19}</td>
</tr>
<tr>
<td></td>
<td>GPP: Health staff should undertake ear examinations when they do regular child health checks.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Accurate surveillance of OME usually requires pneumatic otoscopy or tympanometry.</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Hearing Loss, Speech and Language Surveillance</strong></td>
<td>GPP: Monitor for hearing loss in all children younger than 5 years and in older children at high risk of hearing impairment. Assessment tools include simplified parental questionnaires, pneumatic otoscopy and tympanometry (in children older than 4 months).</td>
<td>IV\textsuperscript{30}</td>
<td>I~A\textsuperscript{16}</td>
</tr>
<tr>
<td></td>
<td>GPP: Refer for hearing tests if there are parental or teacher concerns about hearing or behaviour or learning. The following milestones are an appropriate indication for immediate referral to a paediatrician and an audiologist:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• 3-6 mo: not communicating by vocalising or eye gaze</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• 9 mo: poor feeding or oral coordination</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• 12 mo: not babbling</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• 20 mo: only pointing or using gestures (i.e. not speaking)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
**Hearing Loss, Speech and Language Surveillance continued**

- 24 mo: using <20 words, not following simple requests
- 30 mo: no two word combinations.

### Otoscopy

**Grade A:** Accurate diagnosis of OM requires assessment of the appearance of tympanic membrane (TM) by otoscope (or video otoscope) plus compliance or mobility of the TM by pneumatic otoscopy or tympanometry.

**GPP:** Otoscopy requires a clear view of the TM. Syringing or cleaning with tissue spears may be required to remove wax, pus or foreign bodies from the ear canal.

**GPP:** Cleaning pus from the ear canal with correctly prepared tissues spears can be done by anybody. Syringing with clean warm water can be done by appropriately trained individuals. Cleaning with canal instruments can be done by appropriately trained individuals using direct vision (e.g. a head-light, 'LumiView' or operating microscope). Suctioning by a trained health care professional may also help to obtain a clear view of the eardrum.

**GPP:** Choose the largest diameter otoscope tip that will fit comfortably in the child’s ear.

**Grade A:** A bulging, cloudy or distinctly red TM are the most consistent signs in the diagnosis of AOM.

**Grade A:** Lack of acute inflammation despite visible fluid through an intact TM indicates OME.
### Otoscopy continued

**GPP:** The duration of discharge should be noted. Consideration to be given to documenting the size and position of the TM perforation. This will allow distinction of AOM with perforation from CSOM and the assessment of progression of the disease. AOM with perforation is most common in the first 18 months of life.

**GPP:** All episodes of OM managed by the health clinic (and all associated test findings) should be documented in the medical record.

### Tympanometry

**Grade A:** In cases where the diagnosis of OME is uncertain, tympanometry can be used as an adjunct to otoscopy.

**GPP:** For children at least 4 months of age, tympanometry with a standard 226Hz probe tone is reliable. Infants younger than 4 months may require specialised tympanometric equipment with a higher probe tone frequency.

**Grade A:** A type B tympanogram (flat) may be used to confirm a clinical diagnosis of OME.

**Grade A:** A type A or type C tympanogram (peaked) may be used to confirm a clinical diagnosis of no OM.

### Pneumatic Otoscopy

**Grade A:** Pneumatic otoscopy is the most accurate method of ear examination. It assesses TM mobility. It is recommended for confirming a diagnosis of OME and AOM.

<tbody>
<tr>
<td><strong>OME</strong></td>
<td>Tell the families/caregivers that:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Persistent OME is a frequent complication of episodic OME or AOM in populations at high risk of CSOM (see definition).</td>
<td><img src="#" alt="Evidence" /></td>
<td><img src="#" alt="Evidence-Based Guidelines" /></td>
</tr>
<tr>
<td></td>
<td>• OME frequently resolves spontaneously within a 3 month period in populations at low risk of CSOM.</td>
<td><img src="#" alt="Evidence" /></td>
<td><img src="#" alt="Evidence-Based Guidelines" /></td>
</tr>
<tr>
<td></td>
<td>• Conductive hearing loss (CHL) in OME may be either ‘mild’ or ‘moderate’. It is expected to return to normal when middle ear effusion/fluid resolves. The average hearing loss associated with OME is around 25dB.</td>
<td><img src="#" alt="Evidence" /></td>
<td><img src="#" alt="Evidence-Based Guidelines" /></td>
</tr>
<tr>
<td></td>
<td>• Hearing loss will be greater in bilateral OME, or where a fluid level or bubbles behind the TM are not visible.</td>
<td><img src="#" alt="Evidence" /></td>
<td><img src="#" alt="Evidence-Based Guidelines" /></td>
</tr>
<tr>
<td><strong>AOM</strong></td>
<td>Tell the families/caregivers that:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• AOM may occur as early as within the first few weeks of life. It is most often asymptomatic in populations at high risk of CSOM. Discharge from the perforated eardrum may be the first sign of disease in this group of children.</td>
<td><img src="#" alt="Evidence" /></td>
<td><img src="#" alt="Evidence-Based Guidelines" /></td>
</tr>
<tr>
<td></td>
<td>• Spontaneous resolution of AOM to OME is much less likely in populations at high risk of CSOM.</td>
<td><img src="#" alt="Evidence" /></td>
<td><img src="#" alt="Evidence-Based Guidelines" /></td>
</tr>
<tr>
<td></td>
<td>• AOM frequently resolves spontaneously in populations at low risk of CSOM. Mastoiditis, meningitis and cerebral abscess are all recognised complications of AOM, but are uncommon.</td>
<td><img src="#" alt="Evidence" /></td>
<td><img src="#" alt="Evidence-Based Guidelines" /></td>
</tr>
<tr>
<td>Condition</td>

  • The child is at low risk of developing CSOM  
  • rAOM fails to improve on antibiotic prophylaxis (>3 episodes in 6 months or >4 episodes in 1 year). | \[45,5,28,127\] | **I**~**A**^16,18,14 |
| **ENT Referral**| Grade B: Adenoidectomy is not recommended.                                                   | \[52,118,119,8\]                   |                           |
Management of Chronic Suppurative Otitis Media (CSOM) (OM with persistent middle ear discharge and easily visible eardrum perforation)

<table>
<thead>
<tr>
<th>STRATEGY</th>
<th>RECOMMENDATION AND GRADING</th>
<th>EVIDENCE STUDIES</th>
<th>EVIDENCE-BASED GUIDELINES</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accurate Diagnosis</td>
<td><strong>GPP:</strong> Only diagnose CSOM in children who have persistent ear discharge over 2-6 weeks and a visible eardrum perforation that allows discharge to pass through easily.</td>
<td>IV^7,27,39,124</td>
<td>I~B^23</td>
</tr>
<tr>
<td></td>
<td><strong>GPP:</strong> If the eardrum has only recently perforated, treatment should follow the AOMwIP recommendations. AOMwIP occurs most commonly in the first 18 months of life. Effective treatment will dramatically reduce the incidence of CSOM.</td>
<td>IV^7,5,61</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>GPP:</strong> Document the duration of ear discharge and size (and position) of any perforation.</td>
<td>IV^7</td>
<td>I~A^13</td>
</tr>
<tr>
<td></td>
<td>This allows AOMwIP to be distinguished from CSOM and any progression of severe disease to be monitored. A drawing of the eardrum is often the best way to record size of perforation.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Treatment Cleaning</td>
<td><strong>GPP:</strong> Clean the ear canal by using twisted tissue paper (dry mopping) or syringing with dilute betadine (1:20). Syringing should be the initial treatment if the pus is thick or if the TM cannot be seen. Cleaning must be combined with antibiotic drops in order to reduce the production of more pus.</td>
<td>IV^5,30,25,124,128</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Grade A:</strong> Treatment with disinfectant (such as betadine and acetic acid) alone is not recommended. Disinfectants alone are not as effective as topical antibiotics.</td>
<td>^12,44,7,27,124</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>GPP:</strong> Consider referral for suctioning under direct vision if cleaning and syringing have not been effective.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Grade A:</strong> Treat with topical antibiotics (e.g. ciprofloxacin 2-5 drops 2-4 times a day after cleaning) until ear has been dry for at least 3 days. This may require prolonged periods of treatment.</td>
<td>^44,128,7,5,27,29,124,128</td>
<td></td>
</tr>
<tr>
<td><strong>Systemic Antibiotics</strong></td>
<td><strong>Grade A:</strong> Treatment with oral antibiotics (e.g. quinolones) is not recommended routinely. Oral antibiotics are usually less effective than topical treatment.</td>
<td>j32,27,101,124</td>
<td></td>
</tr>
<tr>
<td><strong>Grade B:</strong> Consider referral (after 3 months of treatment) for intravenous or intramuscular antibiotics (e.g. ceftazidime twice daily). This will usually require hospitalisation for 2-3 weeks and should be discussed with the local doctor.</td>
<td>j32,7,124</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Patient and Family Education</strong></td>
<td>GPP: Show families/caregivers how to do ‘tragal pumping’ (pressing several times on the flap of skin in front of the ear canal). This should always be used after the antibiotics drops are inserted into the ear canal. The topical antibiotic treatment will only work if it can be pushed through the perforation.</td>
<td>j47,112,113,114</td>
<td></td>
</tr>
<tr>
<td>GPP: Tell families/caregivers to:</td>
<td>j15,115,116</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• provide a high level of language stimulation to babies and toddlers</td>
<td>j17,19</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• encourage early attempts at speaking</td>
<td>j18</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• encourage early attempts at writing</td>
<td>j19</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• tell stories and read to young children</td>
<td>j19</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• participate in their children’s early learning at child care centre and preschool.</td>
<td>j19</td>
<td></td>
<td></td>
</tr>
<tr>
<td>GPP: If talking to a hearing impaired person, make sure that you speak slowly and clearly after gaining their attention in well-lit conditions. Health educators should use visual prompts.</td>
<td>j15,116</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Medical Review</strong></td>
<td>GPP: Review 1-2 weekly until the signs of CSOM have resolved. A further review 4 weeks after resolution is recommended.</td>
<td>j17,124</td>
<td></td>
</tr>
<tr>
<td><strong>Audiology Referral</strong></td>
<td>GPP: Refer the patient for audiological management when unilateral or bilateral CSOM persists for 3 months or longer.</td>
<td>j17,124</td>
<td></td>
</tr>
</tbody>
</table>
| Audiology Referral continued | **GPP:** Audiometry referral is also recommended at completion of treatment to inform further referral pathways, or at any time when families or others are concerned about a child's hearing.  
**Refer to Section E: Audiological Assessment and Management** for further guidance on:  
- signs of hearing loss  
- when to refer for hearing help including aids and devices. |
| Speech Therapy Referral | **GPP:** Refer all the children with language, learning or behavioural problems for speech therapy. |
| ENT Referral | **GPP:** Refer to an ENT specialist anyone who fails prolonged medical therapy (e.g. ciprofloxacin 2-5 drops 2-4 times a day after cleaning for 4 months). The ENT specialist is able to confirm the diagnosis, exclude the possibility of a cholesteatoma, and consider the options of tympanoplasty and/or mastoidectomy.  
Anyone with an attic perforation should be referred to an ENT surgeon immediately to exclude cholesteatoma. |
## Management of Dry Perforation
(Presence of a perforation in the eardrum without any discharge)

RECOMMENDATIONS FOR CLINICAL CARE GUIDELINES ON THE MANAGEMENT OF OTITIS MEDIA in Aboriginal and Torres Strait Islander Populations
## SECTION E: AUDIOLOGICAL ASSESSMENT AND MANAGEMENT

*Enhance hearing, communication and access to relevant information*

### When to Perform Audiology Assessment

<table>
<thead>
<tr>
<th>STRATEGY</th>
<th>RECOMMENDATION AND GRADING</th>
<th>EVIDENCE STUDIES</th>
<th>EVIDENCE-BASED GUIDELINES</th>
</tr>
</thead>
</table>
| **GPP:** Tell families/caregivers that hearing assessment is recommended for the following reasons:  
• confirmation of middle ear condition  
• diagnosis of degree and type of hearing loss  
• recommendation for ongoing clinical care  
• monitoring the outcomes of interventions on the peripheral hearing system  
• planning hearing and communication (re)habilitation.  
Audiological assessment contributes different information at each stage in the disease process and the treatment progress. |  |  | I^A^{15} |

### Choice of Audiology Assessment

<table>
<thead>
<tr>
<th>STRATEGY</th>
<th>RECOMMENDATION AND GRADING</th>
<th>EVIDENCE STUDIES</th>
<th>EVIDENCE-BASED GUIDELINES</th>
</tr>
</thead>
</table>
| **GPP:** Tell families/caregivers that hearing can be evaluated at any time after birth. The type of assessment depends upon the:  
• age of the child  
• disease stage/state  
• treatment, referral or (re)habilitation objective(s)  
• access to skills and equipment.  
Valid hearing assessment requires a quiet test environment. |  |  | I^A^{20} |
### Screening and Surveillance

**GPP:** Hearing screening at school entry in populations with near-universal OM and CHL is not recommended. Hearing screening in older asymptomatic children (single pass/fail assessment) is not recommended.

**Regular surveillance** (with appropriate testing when indicated) is preferred to school entry screening.

**GPP:** Put the children with recurrent, persistent and chronic OM conditions on a review register. These children should be assessed as recommended in these guidelines specific to the OM diagnosis.

### Signs of Hearing Loss

**GPP:** Tell families/caregivers that the most obvious clue to the presence of the hearing loss is a history of OM. Hearing loss may have been present for some time before noticeable signs are observed and reported.

**GPP:** Observe and ask questions about hearing behaviors:

- Babies and toddlers with hearing loss might not respond to quiet voices, might not startle in response to loud sounds and might speak later or less clearly than their peers.

- A child or adult with a mild or moderate hearing loss might appear to ‘hear when they want to’ or intermittently. Such a loss is particularly affected by:
  - the presence of background or competing noise
  - use of second language
  - new and unfamiliar speakers
  - new and unfamiliar words or concepts
  - being at a distance from the speaker.

Hearing loss in cross cultural settings can lead to inappropriate assumptions. People might judge a person with hearing loss to be ‘inattentive’, ‘uninterested’, ‘rude’ or ‘stupid’.
### Effects of Hearing Loss

**GPP:** Tell families/caregivers that hearing loss affects verbal and written communication. It is associated with:

- impaired first language acquisition
- impaired second (and later) language acquisition
- inability to follow complex verbal instructions and understand complex verbal information
- poor auditory attention – inability to sustain attention
- slow progress at school leading to limited literacy and numeracy
- poor educational outcomes and subsequent limited access to post-secondary education and training
- high rates of unemployment or low employment status
- impaired social relationships.

### Enhancing Language Acquisition

**GPP:** Encourage families/caregivers to:

- provide a high level of language stimulation to babies and toddlers
- encourage early attempts at speaking
- encourage early attempts at writing
- tell stories and read to young children
- participate in their children’s early learning at child care centre and preschool.

Children with hearing loss often benefit from a quiet environment and additional language stimulation.

### Recommended Educational and Rehabilitation Support

**GPP:** Tell people working with children (e.g. in child care centres, kindergartens, schools) about the high rates of hearing loss and factors affecting hearing in educational settings.
Recommended Educational and Rehabilitation Support

continued

GPP: Tell caregivers and teachers that for children with ongoing mild hearing loss averaging <35dB, the most common forms of intervention include:

- sound-field amplification systems in the classroom
- preferential seating and use of complimentary visual information.

GPP: Tell caregivers and teachers that for children with ongoing mild to moderate hearing loss averaging >35dB, the most common forms of intervention include:

- sound-field amplification systems in the classroom
- personal hearing aid
- visual cues (lip-reading, body language and hand talk), raised speech volume (amplification) and contextual cues in the classroom
- auditory training
- language stimulation and speech correction at home and school.

GPP: Tell caregivers and teachers that for children with severe and profound hearing loss averaging >65dB must urgently receive:

- personal hearing aid
- auditory training
- intensive speech therapy
- support from teachers of the deaf for the development of all language skills.

GPP: Tell families that they can enhance their children’s learning at school by providing support at home.

Written ENT specialist advice is required to advise whether there are any medical contraindications to the fitting of personal amplification.
### Recommended Educational and Rehabilitation Support

In the choice of hearing device, audiologists will consider the following factors:

- presence of discharge
- stability of middle ear
- parent/caregiver/child wishes
- the impact of the hearing loss on the child’s life
- other medical and cultural factors.

### Communicating with a Hearing Impaired Person

**Grade C: If talking to a hearing impaired person**, make sure that you speak slowly and clearly after gaining their attention in well-lit conditions. Health educators should use visual prompts and cues and public address systems if available.

**GPP: Use listening devices to assist communication with hearing-impaired patients.**

**GPP: Speak in the patient’s language** (or use interpreters) to communicate important messages. Try to establish why communication is breaking down e.g. hearing, language or cultural differences?

### Speech Therapy

**GPP: Refer to a speech pathologist** all children suspected of speech and language delay (see list of behaviours to observe under ’Diagnosis of OM’).
## SECTION F-1: PRACTICAL CONSIDERATIONS IN HEALTH CARE DELIVERY

Address implementation issues and barriers to ensure effective, high quality care for all clients

<table>
<thead>
<tr>
<th>STRATEGY</th>
<th>RELEVANT INFORMATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Effective Prevention</td>
<td><strong>Severe OM is usually a disease of poverty.</strong> Improved living standards, maternal education, breast feeding, provision of a smoke free environment and pneumococcal vaccination will decrease rates of acute perforation and CSOM.</td>
</tr>
<tr>
<td></td>
<td><strong>Awareness among families and teachers</strong> for early identification of language, learning and behavioural problems, early hearing assessment and appropriate management is very important for the prevention of OM related hearing loss and its consequences.</td>
</tr>
<tr>
<td></td>
<td><strong>Interpreters</strong> should be used whenever possible if English is not the first language of the family.</td>
</tr>
<tr>
<td></td>
<td><strong>A video otoscope</strong> can assist in helping patients and families to understand ear disease. This may lead to greater engagement in its prevention and management.</td>
</tr>
<tr>
<td></td>
<td><strong>Aboriginal Health Workers are the main workforce delivering primary care services in remote communities. Training and support</strong> should be provided for all health staff to increase adherence to the strategies for improve prevention, diagnosis and management of OM.</td>
</tr>
<tr>
<td></td>
<td><strong>Additional community-based ear workers</strong> may be required to sustain hearing health education programs.</td>
</tr>
<tr>
<td>Effective Diagnosis</td>
<td><strong>Training is required for staff</strong> (including all health workers, nurses and GPs) in the following diagnostic instruments. Training should also cover the appropriate interpretations of results.</td>
</tr>
<tr>
<td></td>
<td><strong>A tympanometer or a wall mounted pneumatic otoscope</strong> is essential equipment for all Community Health Centres. Specific instruction on how to examine young children should be provided. This equipment can help to assess middle ear aeration. It supports the accurate diagnosis of OME.</td>
</tr>
<tr>
<td></td>
<td><strong>A video otoscope</strong> is useful for informing family members about ear problems, for recording changes in the eardrum over time, and for transmitting images for diagnostic review (tele-otology).</td>
</tr>
</tbody>
</table>
### Effective Diagnosis

**A ‘LumiView’** (or similar instrument for hands-free illumination of the ear canal) allows thorough cleaning of the canal under direct vision. This can greatly improve the visualisation of the TM.

**A pure-tone audiometer** enables trained staff (ear health workers, Aboriginal Health Workers and remote nurses) to perform hearing tests. Diagnostic hearing assessments should only be performed by qualified, trained audiologists or audiometrists.

**Standardised, calibrated audiometers and a quiet environment** are required for pure tone audiometry. Do not perform hearing tests if a very quiet room is not available (e.g. heavy rain outside).

**Referral to a major regional hearing** centre is required to determine level of hearing loss in children <3 years of age.

**Telehealth strategies** may result in better diagnosis and management as well as opportunities for ongoing training and support.

### Effective Management

**Early intervention** for detection of OM (and related hearing loss and its consequences) should be made a priority for infant and early childhood health and education programs. Formal collaboration between local health clinics and education services is recommended.

**Compliance** with treatment is essential to achieve expected outcomes. Combinations of appropriate patient instruction, reminders, close follow-up, supervised self-monitoring and rewards for success are recommended.

**Refrigeration of antibiotics** may represent a problem for some families. This issue should be addressed at the time of initial treatment and options proposed e.g. supervised dosing, use of intramuscular antibiotics, single dose azithromycin or use of antibiotic sachets to be made up by families.

**A strategic plan** for the management of OM and hearing loss in individual communities should be developed by local health and education staff. This should be supported by regional and visiting specialist staff. Ideally, this should be evaluated regularly using the available process and outcome indicators.

**Additional process indicators** (e.g. frequency of assessment, detection, treatment, and referral) should be considered in order to monitor the level of service. Each indicator should be defined to ensure that they can influence continuous quality improvement without being a burden. Health Centre record reviews can help in monitoring levels of activity.
Disease registers (clinic-based recall and reminder systems) are recommended for all chronic illnesses that improve with adherence to a structured treatment plan. Health practitioners should consider putting all children with CSOM and persistent hearing loss on disease registers (local clinic-based recall and reminder systems). This can be used to ensure regular review and to follow clinical progression or resolution of the disease.

Disease registers may also include clear information on all diagnostic findings, results of hearing assessment and other tests, treatments given, referral notes and findings. They should support two way communication between primary care and audiology/ENT/speech services.

There should be a written ENT management plan available after each ENT procedure. The visiting ENT surgeon should be available via phone/email for post operative concerns.

Access to specialist services (Audiology and ENT) is essential in the provision of comprehensive care. When referral to an audiologist for full hearing assessment is necessary (and if they cannot be seen locally), the family should be given the option of travelling to a major centre. Where referral is indicated, the hearing test should occur within 3 months, and review by an ENT surgeon should occur as soon as possible and within 6 months.

Access to speech therapy is essential for those children who suffer from speech and language problems. The primary care workers should be given information about the ‘Education Services’ and ‘Disability Support Units’, and how to access other relevant services in their region.

Schools and other educational services should be aware of educational resources that are locally available. This would include the access to Health Centres, ‘Teachers of the Deaf’, ‘Advisory Visiting Teachers’, and sound field amplification systems.

Hearing assessments in regional centres may need to be booked in conjunction with a medical appointment to ensure that travel assistance is available.

ENT surgeons are responsible for ensuring that a post-operative management plan is available for each individual who has surgery. Written recommendations should be discussed with the appropriate health care providers.
SECTION F-2: PRIORITISATION OF PRIMARY HEALTH CARE SERVICES IN DIFFERENT SETTINGS

When resources are limited, focus on those most likely to benefit from the recommendations contained within this document. Develop a health care strategy for your organisation. The strategy should cover prevention, diagnosis and management.

PRIORITY 1: Children <3 years old with discharging ears
(These children will have either AOMwiP or early onset CSOM.)

The aim of the program is to identify children early, provide appropriate antibiotic treatment, organise weekly follow ups and optimise adherence strategies. This all needs to continue until resolution of discharge is achieved.

Appropriate antibiotic treatment is the key to a better health outcome. Treatment may need to be continued for many months.

<table>
<thead>
<tr>
<th>KEY STEPS</th>
<th>RECOMMENDED ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Effective Prevention</td>
<td>1) Organise individual or group education sessions to discuss early onset of OM, signs/symptoms of OM and preventive measures to decrease OM and associated hearing loss.</td>
</tr>
<tr>
<td></td>
<td>2) Encourage breast feeding, avoidance of passive smoking exposure and reducing exposure to germs (through frequent hand and face washing and drying).</td>
</tr>
<tr>
<td></td>
<td>3) Ensure the recommended pneumococcal vaccination is given as per schedule.</td>
</tr>
<tr>
<td>Effective Diagnosis</td>
<td>1) Ensure accurate diagnosis with otoscope (video otoscope preferred). Document duration of discharge and size (and position) of perforation (if possible).</td>
</tr>
<tr>
<td></td>
<td>2) Distinguish between AOMwiP and CSOM by history and review of medical record.</td>
</tr>
<tr>
<td></td>
<td>3) Use syringing/suctioning if required to obtain clear view of TM for more accurate diagnosis.</td>
</tr>
<tr>
<td></td>
<td>4) Refer (or send video images) for second opinion if there is a doubt about the diagnosis.</td>
</tr>
</tbody>
</table>
## Effective Management

### AOMwiP

1. **Organise weekly review** and update register (local clinic-based recall and reminder systems) of affected children every month.

2. **Ensure that high dose antibiotic** therapy (amoxycillin or amoxycillin-clavulanate) plus **topical ciprofloxacin** (2-5 drops 2-4 times a day) after ear cleaning are being given to all children who do not respond oral antibiotics within 4-7 days.

3. **Ensure that the ear cleaning is effective** and that the antibiotic drops are being pushed through the perforation.

5. **Discuss option of long-term antibiotics** with family. This would continue even after the episode of AOMwiP has resolved.

6. **Refer for hearing assessment** after 3 months or at any time there are concerns.

### Early Onset CSOM

1. **Organise weekly review** and update register (local clinic-based recall and reminder systems) of affected children every month.

2. **Ensure that topical ciprofloxacin** (2-5 drops 2-4 times a day) is being given after ear cleaning.

3. **Ensure that the cleaning is effective** and that the antibiotic drops are being pushed through the perforation.

5. **Discuss option of long-term antibiotics** with family. This would continue even after the episode of CSOM has resolved.

6. **Refer for hearing assessment** after 3 months or at any time there are concerns.

7. **Discuss option of hospitalisation** for parenteral antibiotic administration if no response to topical antibiotic treatment after 16 weeks.
**PRIORITY 2:** Children <10 years old who have hearing loss of >25dB (in the better ear) plus speech/language/communication problems  
(These children may have any form of OM.)

The aim of the program is to ensure that speech therapy and audiological management occur while medical treatment is optimised.

Appropriate medical treatment requires an accurate diagnosis and regular long-term follow up. A multidisciplinary approach adapted to meet the needs of the child is the key to a better health outcome. These children are likely to need ongoing ear health and hearing monitoring and hearing support throughout childhood.

<table>
<thead>
<tr>
<th>KEY STEPS</th>
<th>RECOMMENDED ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Effective Prevention</td>
<td>1) Organise individual or group education sessions to discuss early onset of OM, signs/symptoms of OM and preventive measures to decrease OM associated hearing loss.</td>
</tr>
<tr>
<td></td>
<td>2) Encourage family to participate actively in learning and language development. Provide support for reading, speaking and writing activities at home.</td>
</tr>
<tr>
<td>Effective Diagnosis</td>
<td>1) Distinguish between persistent OME, rAOM, CSOM and dry perforation by accurate diagnosis with otoscopy (video otoscope preferred) and tympanometry or pneumatic otoscopy.</td>
</tr>
<tr>
<td></td>
<td>2) Review the history and medical record, and preferably document size and position of the perforation (if present). Also document the type and severity of the speech/language/communication problem.</td>
</tr>
<tr>
<td></td>
<td>3) Refer (or send video images) for second opinion if there is a doubt about diagnosis.</td>
</tr>
<tr>
<td>Effective Management</td>
<td>1) Ensure medical management of OM as per guidelines.</td>
</tr>
<tr>
<td></td>
<td>2) Review regularly (3-6 monthly).</td>
</tr>
<tr>
<td></td>
<td>3) Tell families/caregivers and teachers that children’s listening may be affected in the following situations:</td>
</tr>
<tr>
<td></td>
<td>» being far away from person speaking</td>
</tr>
<tr>
<td></td>
<td>» background or competing noise</td>
</tr>
<tr>
<td></td>
<td>» use of a second language</td>
</tr>
<tr>
<td></td>
<td>» new and unfamiliar speakers</td>
</tr>
<tr>
<td></td>
<td>» new and unfamiliar words or concepts.</td>
</tr>
<tr>
<td></td>
<td>4) Recommend preferential sitting and the use of visual cues (lip-reading, body language and hand talk), raised speech volume (amplification) and contextual cues in the classroom.</td>
</tr>
<tr>
<td></td>
<td>5) Recommend sound-field classroom amplification and use any amplification devices recommended by the audiologist.</td>
</tr>
</tbody>
</table>
6) **Advise family** to participate actively in learning and language development.

7) **Repeat** hearing tests after 3 months.

8) **Refer to an ENT specialist for:**
   - grommet insertion for persistent OME
   - myringoplasty for dry perforation.
**PRIORITY 3:** Children aged 3-10 years old who have discharging ears
(These children will generally have CSOM.)

Once established, CSOM can be extremely difficult to treat (this is why the Priority-1 is so important).

The aim of the program is to support long-term topical antibiotic treatment combined with appropriate audiological management.

Adherence to the treatment and regular follow up every 1-2 weeks is the key to a better health outcome. Specialist review may be needed if the diagnosis is unclear or if the child does not respond to the treatment.

| **Effective Prevention** | 1) Organise individual or group education sessions to discuss the severity of CSOM and associated hearing loss.  
2) Encourage family to participate actively in learning and language development. Provide support for speaking, reading and writing activities at home. |
| **Effective Diagnosis** | 1) Ensure accurate diagnosis with otoscope (video otoscope preferred) and medical records and distinguish between AOMwiP and CSOM by history and reviewing medical record. Most children will have CSOM.  
2) Document duration of discharge and preferably size (and position) of the eardrum perforation (if possible).  
3) Use syringing/suctioning if required to obtain clear view of TM for accurate diagnosis.  
4) Refer (or send video images) for second opinion if there is doubt about diagnosis.  
5) Refer for hearing assessment. |
| **Effective Management** | 1) Organise 1-2 weekly reviews and updates (local clinic-based recall and reminder systems) register of affected children every month.  
2) Ensure that topical ciprofloxacin (2-5 drops 2-4 times a day) is being given after ear cleaning.  
3) Ensure that ear cleaning is effective and make sure that the antibiotic drops are being pushed through the perforation.  
4) Review strategies to improve adherence with recommended treatment.  
5) Consider hospitalisation for parenteral antibiotic if there is no response to topical antibiotic treatment after 16 weeks.  
6) Recommend preferential seating and the use of visual cues (lip-reading, body language and hand talk), raised speech volume (amplification) and contextual cues in the classroom.  
7) Recommend sound-field classroom amplification and support use of amplification devices recommended by the audiologist. |
Effective Management continued

8) Advise family to participate actively in learning and language development.
9) Refer to an ENT specialist if the diagnosis is uncertain or there is no response to medical therapy.
10) Refer to speech pathologist if this is indicated.
**PRIORITY 4:** Other children aged <10 years old with persistent OM or tympanic abnormality and hearing loss >35dB in the better hearing ear
(These children will generally have persistent OME or a badly scarred eardrum.)

The aim of the program is to provide audiological management for all children and identify those children who will benefit from surgery.

Enhanced communication strategy and appropriate use of hearing aids is the key to a better health outcome.

<thead>
<tr>
<th>KEY STEPS</th>
<th>RECOMMENDED ACTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Effective Prevention</strong></td>
<td>1) <strong>Encourage family</strong> to participate actively in learning and language development. <strong>Provide support</strong> for reading, speaking and writing activities.</td>
</tr>
<tr>
<td></td>
<td>2) <strong>Increase awareness of the education staff</strong> about support strategies for children with hearing loss.</td>
</tr>
<tr>
<td><strong>Effective Diagnosis</strong></td>
<td>1) <strong>Make accurate diagnosis</strong> by otoscope (video otoscopy preferred).</td>
</tr>
<tr>
<td></td>
<td>2) <strong>Distinguish</strong> between bilateral persistent OME, dry perforation and other TM abnormalities (like scarring or severe retraction).</td>
</tr>
<tr>
<td></td>
<td>3) <strong>Refer for hearing assessment</strong>.</td>
</tr>
<tr>
<td><strong>Effective Management</strong></td>
<td>1) <strong>Recommend preferential seating and the use of visual cues</strong> (lip-reading, body language and hand talk), raised speech volume (amplification) and contextual cues in the classroom.</td>
</tr>
<tr>
<td></td>
<td>2) <strong>Refer for appropriate hearing aid</strong>.</td>
</tr>
<tr>
<td></td>
<td>3) <strong>Recommend effective communication strategies</strong>.</td>
</tr>
<tr>
<td></td>
<td>4) <strong>Recommend auditory training support</strong> from speech therapist.</td>
</tr>
<tr>
<td></td>
<td>5) <strong>Recommend language stimulation</strong> and speech correction at home and school.</td>
</tr>
<tr>
<td></td>
<td>6) <strong>Repeat hearing assessment</strong> after 3 months.</td>
</tr>
<tr>
<td></td>
<td>7) <strong>Refer to an ENT specialist for:</strong></td>
</tr>
<tr>
<td></td>
<td>» grommet insertion for persistent OME</td>
</tr>
<tr>
<td></td>
<td>» myringoplasty for dry perforation.</td>
</tr>
<tr>
<td></td>
<td>8) <strong>Organise a repeat medical review</strong> after 3 months and update register (local clinic-based recall and reminder systems) of affected children regularly.</td>

</table>
METHODS USED IN DEVELOPING THE GUIDELINES

Aim

To develop a series of clear recommendations relevant to the clinical care of Aboriginal and Torres Strait Islander Australians that are:

i) based on the best available evidence
ii) acceptable to a multi-disciplinary expert panel experienced in this area
iii) presented in plain English and incorporated into algorithms.

Identification of Important Clinical Care Questions

The information contained within the ‘Recommendations for Clinical Care Guidelines on the Management of Otitis Media in Aboriginal and Torres Strait Islander Populations - March 2001’ was reviewed and compared to the available new high quality evidence-based guidelines and systematic reviews. Additional draft recommendations were suggested by the Darwin Otitis Guidelines Group and the Technical Advisory Group. These statements were then converted into evidence-based clinical questions. These questions were answered using the best available evidence identified by the search strategy used in the Recommendations of March 2001 and updated by the Guidelines Group in April 2010. The final recommendation had to be consistent with this evidence.

Search Strategy

We used a hierarchical approach to identify the best available evidence relevant to the recommendations. The search strategy described in Phase 1 was used to find all the relevant evidence-based guidelines, evidence summaries and systematic reviews. The search strategy described in Phase 2 was used to find well-designed original studies relevant to the management of OM published since 2001. These searches were modified versions of the filters available through Clinical Queries in PubMed (US National Library of Medicine). For clinical questions that were not addressed in the original Guidelines, the search strategy was extended to cover studies published prior to 2001 (in the Cochrane Library and MEDLINE database).

Phase 1

1. otitis OR hearing loss

3. Handsearch of “Evidence-Based Otitis Media” and “Clinical Evidence, April 2010.”

in the Cochrane Library, Issue 2, 2010 and limited to reviews (accessed on 1st April 2010).

A)D

in the Cochrane Library, 2010 and limited to studies listed in the Controlled Clinical Trials Register and published since 2001 (accessed on 1st April 2010).

in the Cochrane Library, 2010 and limited to studies listed in the Controlled Clinical Trials Register and published since 2001 (accessed on 1st April 2010).

in MEDLINE and limited to publications since 1997 (accessed via PubMed on 1st April 2010).

10. otitis OR hearing loss

in the Aboriginal and Torres Strait Islander Health Information database and limited to publications since 1997 (accessed via http://www.healthinfonet.ecu.edu.au/ on 1st April 2010).

Result of Search

A thorough literature search identified more than 300 articles. Additional references were identified by group members and peer reviewers. All material was assessed and evidence synthesised in accordance with NHMRC methodology.

Material not deemed to be of sufficient quality was discarded. Overall, we identified 51 evidence-based guidelines, reviews, and summaries: 12 evidence-based guidelines, 10 clinical evidence reports, 1 evidence-based textbook, 21 Cochrane Systematic Reviews, and 7 other systematic reviews. Nearly all of these were new publications. When necessary, we extended our search prior to 2001 to address new clinical questions. On the basis of this explicit search, we prepared 116 recommendations. Out of these, we have 23 recommendations which are based on Cochrane Systematic Reviews. Those recommendations which are not evidence-based, but considered to be good practice by the expert panel, have been labelled as Good Practice Points (GPP).

Links to Best Available Evidence

Each recommendation has been explicitly linked to the level of evidence on which it is based. All relevant Level I Evidence Studies and Guidelines have been referenced. Selections of the best Level II, Level III and Level IV Evidence Studies have also been referenced. The source of expert opinion for Good Practice Points has not been referenced.

RECOMMENDATIONS FOR CLINICAL CARE GUIDELINES ON THE MANAGEMENT OF OTITIS MEDIA in Aboriginal and Torres Strait Islander Populations

(110) Leach AJ, Morris PS, Mathews JD. Compared to placebo, long-term antibiotics resolve otitis media with effusion (OME) and prevent acute otitis media with perforation (AOMwiP) in a high-risk population: a randomized controlled trial. BMC Pediatr 2008 Jun 2;8:23.

RECOMMENDATIONS FOR CLINICAL CARE GUIDELINES ON THE MANAGEMENT OF OTITIS MEDIA in Aboriginal and Torres Strait Islander Populations

ALGORITHM 1: Could this child have a middle ear infection (otitis media)?

Can you see discharge in the ear canal or next to the eardrum?

- Yes
- No

Is there a bulging eardrum or ear pain?

- Yes
- No

Is there a perforation (hole in eardrum)?

- Yes
- No

Is at least one eardrum translucent (see through), with no signs of a fluid level? [Confirm with tests for eardrum mobility (pneumatic otoscopy) and tympanometry whenever possible]

- Yes
- No

- OME

Is effusion present for >3 months?

- Yes
- No

- Normal eardrum(s) and probably normal hearing
- Continue to review regularly

Has there been discharge through a perforation (hole in eardrum) present for >2-6 weeks and documentation of persistence and size of perforation?

- Yes
- No

- Otitis externa (See alternative guidelines)

Is the ear canal swollen and sore?

- Yes
- No

AOM without perforation

Dry perforation

AOM with perforation

CSOM
ALGORITHM 2: Management of an episodic OME in high-risk populations.

- No investigation or treatment required
- Continue to review regularly

Concerns about language, learning, behavioural or developmental problems

Yes
- Refer for hearing assessment

No
- Continue to review. If OME persists beyond 3 months refer to Algorithm 3.
ALGORITHM 3: Management of Persistent OME in high-risk populations.

Refer for hearing assessment if bilateral OME for >3 months.

- **Hearing loss <20dB**
  - Bilateral OME with normal hearing
    - Continue to review regularly
    - Refer for ENT assessment only if severe retraction present (i.e. retraction pocket or atelectasis).

- **Hearing loss 20-35dB**
  - Bilateral OME with mild hearing loss
    - Continue to review regularly
    - Recommend strategies to improve quality of communication and use of classroom and personal amplification systems
    - Ensure ongoing audiological and educational support
    - Consider ENT referral

- **Hearing loss >35dB**
  - Bilateral OME with mild-moderate hearing loss
    - Continue to review regularly
    - Recommend strategies to improve quality of communication
    - ENT referral for grommet surgery
    - Refer for hearing aids if surgery unavailable or unsuccessful
    - Ensure ongoing audiological and educational support.
RECOMMENDATIONS FOR CLINICAL CARE GUIDELINES ON THE MANAGEMENT OF OTITIS MEDIA in Aboriginal and Torres Strait Islander Populations

ALGORITHM 4: Management of Acute Otitis Media without perforation (AOMwoP) in high-risk populations.

- Analgesics if pain present
- Amoxycillin 50mg/kg/day for at least 1 week
- Consider if high dose of antibiotics necessary.

Bulging eardrum resolved

Review at 4-7 days

Bulging eardrum

- Continue amoxycillin at high dose 90mg/kg/day for 1 more week
- Review again after 1 week.

Have there been 3 or more episodes of AOM in last 6 months or 4 or more episodes in a last year?

Yes
- Recurrent AOM (rAOM)
  - Discuss option of prophylactic antibiotics (amoxycillin 25-50mg/kg 1-2 times daily) with family.

No
- AOM resolved
  - Continue to review regularly.

Bulging eardrum resolved/persistence effusion without signs of acute inflammation

- Persistent AOM
  - Continue amoxycillin 90mg/kg/day or start amoxycillin-clavulanate 90mg/kg/day and review adherence
  - Continue to review weekly

Bulging eardrum persists

AOM with Perforation

See Algorithm 5

Eardrum burst
**ALGORITHM 5:** Management of Acute Otitis Media (AOM) with perforation in high-risk populations.

**AOM with Perforation**

- Treat with amoxycillin 50-90mg/kg/day for at least 1 week
- Review after one week

**Discharge and bulging eardrum resolved**

**Have there been 3 or more episodes of AOM in last 6 months or 4 or more episodes in a last year?**

- No
- Yes

**Discharge and bulging eardrum resolved**

**Discharge or bulging eardrum persists**

- **AOM resolved**
  - Discuss option of prophylactic antibiotics (amoxycillin 25-50mg/kg 1-2 times daily) with family.
- **Recurrent AOM**
  - Discuss option of prophylactic antibiotics (amoxycillin 25-50mg/kg 1-2 times daily) with family.
- **CSOM**
  - Discharge through a persistent and easily visible perforation present for >6 weeks despite appropriate treatment for AOM.

**See Algorithm 6**
ALGORITHM 6: Management of Chronic Suppurative Otitis Media (CSOM) in high-risk populations.

- Regular treatment not possible
  - Consider supervised dosing or use of a school-based program.

- CSOM treatment
  - Ciprofloxacin 2-5 drops 2-4 times a day after dry mopping
  - Continue until ear dry for at least 3 days (this may require prolonged periods of treatment)
  - Continue to review weekly.

- Persistent CSOM (after 4 months of treatment)
  - Consider hospital admission for IV or IM ceftazidime. (Discuss with local Medical Officer)

- Hearing loss <20dB
  - CSOM with normal hearing
    - Continue to review regularly
    - Consider ENT referral.*

- Hearing loss 20-35dB
  - CSOM with mild hearing loss
    - Recommend strategies to improve quality of communication, and use of classroom and personal amplification systems
    - Ensure ongoing audiological and educational support
    - Consider ENT referral.*

- Hearing loss >35dB
  - CSOM with mild-moderate hearing loss
    - Recommend strategies to improve quality of communication
    - Refer for ENT assessment for mastoidectomy/tymanoplastic
    - Refer for hearing aids
    - Ensure ongoing audiological and educational support.

- Middle ear still wet (i.e. discharging)
  - Regular treatment not possible
    - Continue to review regularly
    - Advise to keep ear as dry as possible.

- Middle ear dry
  - Regular treatment possible

- Dry perforation
  - Refer for hearing assessment

- Hearing loss <20dB
  - CSOM with normal hearing
    - Continue to review regularly
    - Consider ENT referral.*

- Hearing loss 20-35dB
  - CSOM with mild hearing loss
    - Recommend strategies to improve quality of communication, and use of classroom and personal amplification systems
    - Ensure ongoing audiological and educational support
    - Consider ENT referral.*

- Hearing loss >35dB
  - CSOM with mild-moderate hearing loss
    - Recommend strategies to improve quality of communication
    - Refer for ENT assessment for mastoidectomy/tymanoplasty
    - Refer for hearing aids
    - Ensure ongoing audiological and educational support.

*Cholesteatoma is another cause of persistent discharge. It can be excluded by ENT assessment.
ALGORITHM 7: Management of Dry Perforation in high-risk populations.

- **Dry perforation with normal hearing**
  - Continue to review regularly
  - Consider ENT referral if recurrent infections are a problem.

- **Dry perforation with mild hearing loss**
  - Recommend strategies to improve quality of communication, and use of classroom and personal amplification systems
  - Ensure ongoing audiological and educational support
  - Consider ENT referral.

- **Dry perforation with mild-moderate hearing loss**
  - ENT referral for consideration of eardrum repair (tympanoplasty)
  - Refer for hearing aids
  - Ensure ongoing audiological and educational support.

**How long has the dry perforation (hole in eardrum) been present?**

- **>3 months**
  - Refer for hearing test

- **<3 months**
  - Review in 3 months

- **Hearing loss <20dB**

- **Hearing loss 20-35dB**

- **Hearing loss >35dB**
ALGORITHM 8: Could this child have an important hearing loss due to otitis media?

- **Bilateral OME** >3 months
- **rAOM**
- **CSOM** >3 months
- **Dry Perforation** >3 months
- **Speech, language, developmental delay or behavioural problems**
- **Family concerns**

Continue medical treatment
See Algorithms 5 and 6.

Refer for hearing assessment

- **Hearing loss <20dB**
  - Normal hearing
  - Continue to review regularly.

- **Hearing loss 20-35dB**
  - Mild hearing loss
  - Recommend strategies to improve quality of communication: sound-field amplification system in the classroom and personal amplification systems
  - Ensure ongoing audiological and educational support
  - Consider ENT referral.

- **Hearing loss >35dB**
  - Mild-Moderate hearing loss
  - Recommend strategies to improve quality of communication
  - Refer for ENT assessment
  - Refer for hearing aids
  - Ensure ongoing audiological and educational support.
KEY MESSAGES
FOR PRIMARY HEALTH CARE PROVIDERS

Aboriginal and Torres Strait Islander health staff working with Aboriginal and Torres Strait Islander families are likely to have the greatest impact on severe otitis media.

1. Families should be told that Aboriginal children are at greatly increased risk of severe otitis media (OM).

2. Families should be told that severe OM will get better with improved living standards, maternal education, breast feeding, provision of a smoke free environment and pneumococcal vaccination.

3. Families should be encouraged to attend the local health clinic as soon as possible whenever a child develops ear pain or discharge.

4. Frequent ear examinations are recommended even when the child is well. Use pneumatic otoscopy or tympanometry whenever possible.

5. Antibiotics (amoxycillin) are recommended for Aboriginal children with acute otitis media (identified by bulging eardrum or recent perforation). Antibiotics should be continued until the bulging and discharge have resolved.

6. Chronic suppurative otitis media (CSOM) should only be diagnosed in children who have persistent discharge through a perforation despite appropriate treatment for acute otitis media with perforation. Effective treatment of CSOM requires a long-term approach with regular dry mopping or syringing of ear discharge followed by the application of topical antibiotics.

7. All children with persistent bilateral OM (all types) for greater than 3 months should have their hearing assessed.

8. Families of children with significant hearing loss (>20dB) should be informed of the benefits of improved communication strategies and hearing aids.

9. Explain to families/caregivers that a child needs to hear people talking in order to learn to talk themselves. Children with OM do not hear well. They will benefit from lots of focussed verbal communication.

10. Aim to provide patients or families/caregivers with the knowledge to manage their own health needs. Use communication techniques and resources that facilitate true understanding.
