

Interactive View – document weight Care Delivery

Quick reference guide

A patient's weight should be documented in Interactive View in PowerChart.

1. Go to Interactive View, Measurements.

2. Enter in the patient's Measured Weight.

Note: The measured weight entered into iView is the weight that is reflected in the Patient Banner Bar.

F; 17 years; **Wt: 56 kg** 28-Mar-2018

Note: It is the Measured Weight only that pulls into the medication scratchpad or the medication dosing calculator for weight based medications.

This weight will continue to pull through to the medication scratchpad for 7 days after the last documented measured weight date. This is to ensure that a clinically appropriate weight is used and a blank field acts as a prompt for a re-weigh.

Note: If there is no measured weight documented for the patient when ordering medication, no weight will automatically pull through to the scratchpad.

- You can alter the weight in the dose calculator if required, e.g. dry weight, if clinically appropriate.
- Documenting a manual weight in the scratchpad will not write back to iView or update the Patient Banner Bar.

It is still important to update the Measured Weight in iView of Advanced Growth Chart as soon as practical for ongoing clinical review and accurate weight based medication dosing.
