Purpose

This document provides clinical guidance for all staff involved in the care and management of a child presenting to an Emergency Department (ED) in Queensland with a suspected or confirmed foreign body in the nose.

This guideline has been developed by senior ED clinicians and Paediatricians across Queensland, with input from ENT specialists, Queensland Children’s Hospital, Brisbane. It has been endorsed for use across Queensland by the Queensland Emergency Care of Children Working Group in partnership with the Queensland Emergency Department Strategic Advisory Panel and the Healthcare Improvement Unit, Clinical Excellence Queensland.

Key points

- Consequences of nasal foreign bodies range from local irritation at insertion site, to serious complications including death.
- Urgent ENT referral (onsite or via Retrieval Services Queensland (RSQ)) is required for button batteries and paired magnets due to the risk of necrosis of surrounding tissue.
- The first attempt at removal of a foreign body from the nose has the best chance of success.
- Refer to ENT for removal if first attempt (via any method) is unsuccessful.

Introduction

Nasal foreign bodies are more common in the following children:

- aged two to five years
- intellectual impairment (may have multiple foreign bodies and repeated episodes)

Common foreign bodies include food, paper and small toy parts. Most nasal foreign bodies are found in the anterior nasal cavity between the floor of the nose and inferior turbinate.¹ High rates (92-98%) of successful removal in ED have been reported.
Button batteries

Button batteries require immediate removal due to the risk of necrosis of the surrounding tissue.

There are two main mechanisms by which button batteries can cause necrosis:
- where there is sufficient retained battery charge, hydrolysis and creation of hydroxide ions in adjacent tissues leads to mucosal burn at battery’s negative pole
- direct pressure

Despite prompt removal, the risk of injury can continue up to weeks post-insertion due to residual alkali and weakened tissues.

Assessment

**ALERT** – Button batteries require immediate removal to prevent necrosis of surrounding tissue and septal perforation.

When to suspect a foreign body in the nose

Most children with a nasal foreign body are asymptomatic. A history of insertion may be reported by the child or the caregiver. Delayed presentations are usually triggered by parents noticing blood stained purulent discharge or a bad smell.

Regardless of a history of insertion, consider a nasal foreign body in children presenting with any of the following symptoms:
- nasal occlusion
- epistaxis
- malodourous, purulent or blood-stained nasal discharge (usually unilateral but may be bilateral if multiple foreign bodies or in case of septal perforation)
- facial swelling and/or facial pain
Differential diagnoses for suspected nasal foreign body

<td>Upper respiratory tract infection</td>
</tr>
<tr>
<td>Rhinitis</td>
</tr>
<tr>
<td>Sinusitis</td>
</tr>
<tr>
<td>Unilateral choanal atresia</td>
</tr>
<tr>
<td>Tumour</td>
</tr>
</tbody>
</table>

**Investigations**

X-rays are not routinely recommended as the objects inserted are rarely radiopaque but must be considered if there is a possibility of a button battery or paired magnets which cannot be directly visualised.

Contact Retrieval Services Queensland (RSQ) to arrange urgent transfer of a child with a suspected button battery and no X-ray facilities are onsite.

**Management**

Refer to Appendix 1 for a summary of the emergency management for a child with a nasal foreign body.

Urgent ENT referral (onsite or via RSQ) is required for the following children:
- button battery in nose
- history of insertion and bleeding or airway issues

Refer to ENT as per local practices in the following circumstances:
- multiple unsuccessful attempts at removal prior to ED presentation
- foreign body is posterior and not easily visualised
- paired magnets or magnet and metallic object across nasal septum
- chronic or impacted foreign bodies with marked inflammation
- penetrating or hooked foreign bodies

**Principals of foreign body removal**

- first attempt offers the best chance of success
- choose the best method based on exact location, shape and composition of foreign body (see methods below)
- be aware of the risk of trauma and/or posterior displacement and aspiration in a poorly compliant child

**Preparation for foreign body removal**

- engage two staff members to assist (in addition to carer)
- provide developmentally appropriate information and encouragement and use demonstration or role play to prepare the child for the procedure
- position the child appropriately (upright or lying down)
  - upright positioning encourages a sense of control thereby minimising distress
The risk of aspiration in foreign bodies
Sedation is not recommended
including
methods aim
Recommended methods of removal include
Methods of removal aspiration.
Blind attempts at removal are not recommended due to risk of posterior dislodgement and aspiration.

Alert – Topical nasal drops including local anaesthetic and vasodilators are contra-indicated in button battery cases. They may increase the risk of posterior displacement and aspiration or local necrosis.

Methods of removal
Recommended methods of removal include positive pressure or mechanical extraction. Positive pressure methods aim to push the foreign object anteriorly either completely out of nasal passage or into a visible range where it can be grasped by other instruments. These methods carry a theoretical risk of barotrauma including periorbital subcutaneous emphysema. Irrigation and use of glue are not routinely recommended. Sedation is not recommended as may increase the risk of aspiration.
The risk of aspiration in foreign bodies that are unable to be removed is estimated to be 1 in 1,500 patients. Referral for elective removal is therefore acceptable with appropriate safety-net advice for the family.

Positive pressure removal methods for nasal foreign body

<table>
<thead>
<tr>
<th>Method</th>
<th>Indication</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Self-blow / exhale technique</td>
<td>• recommended for removal of small, smooth, spherical objects in a cooperative patient (usually greater than three years of age)</td>
<td>• child is encouraged to blow their nose whilst occluding the nostril opposite to the foreign body</td>
</tr>
<tr>
<td>Parent’s kiss</td>
<td>• recommended for removal of small, smooth, spherical objects well tolerated even in small children without requiring restraint</td>
<td>• caregiver seals the child’s mouth with their mouth whilst occluding the unaffected nostril then gives a short sharp puff of air to dislodge the foreign body.</td>
</tr>
</tbody>
</table>
### Mechanical extraction removal methods for nasal foreign body

<table>
<thead>
<tr>
<th>Method</th>
<th>Indication</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Forceps (including Magill,</td>
<td>• recommended for soft, irregular small objects</td>
<td>• gently grasp the object with the forceps and pull out of nares</td>
</tr>
<tr>
<td>alligator, packing, toothed</td>
<td>• not recommended if object is smooth, round or friable</td>
<td>• avoid repeated grasping attempts as may push more posteriorly</td>
</tr>
<tr>
<td>and non-toothed forceps)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Probe (e.g. Jobson-Horne probe)</td>
<td>• recommended for hard non-graspable objects which do not fully occlude nares</td>
<td>• probe tip passed beyond and posterior to object and removed by pulling object anteriorly and out of the nare</td>
</tr>
<tr>
<td>Suction</td>
<td>• recommended for smooth or spherical visible mobile objects</td>
<td>• use micro suction tube (Schuknecht tube or Frazier tip) attached to wall suction to form a solid seal between tube and object</td>
</tr>
<tr>
<td>Balloon catheter (e.g. small</td>
<td>• recommended for smooth round foreign bodies which do not fully occlude the nasal passage</td>
<td>• lubricate the catheter and advance past the object, partially inflate the balloon and withdraw</td>
</tr>
<tr>
<td>foley or commercial catheter)</td>
<td>• risk posterior displacement of foreign body</td>
<td></td>
</tr>
<tr>
<td>Magnetic device (see image</td>
<td>• consider for removal of metallic objects such as ball bearings or button</td>
<td>• slowly and safely introduce the magnet into the nose until an audible or palpable click is produced at which point carefully withdraw</td>
</tr>
<tr>
<td>below)</td>
<td>batteries if visible</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• risk pushing foreign body further into nose</td>
<td></td>
</tr>
</tbody>
</table>

⚠️ Refer to ENT as per local practice if first attempt at removal of foreign body (via any method) is unsuccessful.

### Post-removal care

- inspect nasal orifice to exclude co-existing foreign body and trauma
- examine other nasal and aural orifices for additional foreign bodies
Escalation and advice outside of ED

Clinicians can contact the services below to escalate the care of a paediatric patient as per local practices. Button battery cases require urgent transfer if removal onsite is not possible. Other nasal foreign bodies requiring specialist referral are usually managed as an outpatient.

**Button battery insertions**

**ALERT** – Button batteries require immediate removal to prevent necrosis of surrounding tissue.

<table>

</table>
| ENT     | For urgent removal of button battery. | Onsite or via Retrieval Services Queensland (RSQ). For facilities with no onsite service contact RSQ (Ph: 1300 799 127) to request urgent transfer of a child:  
  - requiring removal of button battery (as time-critical)  
  - requiring X-rays if button battery is suspected but unable to be visualised and no X-ray facility onsite (as time-critical). |
|         |                    | RSQ (access via QH intranet)  
Notify early of children potentially requiring transfer. |

Potential complications following removal of nasal foreign body

- rhinorrhoea
- epistaxis
- ulceration of the nasal mucosa
- perforation of nasal septum
- nasal or choanal stenosis
- infection
- ingestion
- sinusitis
- periorbital cellulitis
- meningitis

In the event of epistaxis, apply direct pressure to control the bleeding. Refer to [Epistaxis guideline](#) (QH only).

🚫 Refer to ENT as per local practice in child with significant complications.

</tbody>
</table>

Disposition

A child may be discharged following successful removal of the foreign body.

On discharge, provide accident prevention advice to caregiver/s including:

• safe storage of small objects including marbles, coins, button batteries and balloons to ensure out of reach of infants and young children
• ensuring toys for play are appropriate for developmental age

Follow-up

• advise caregiver/s to seek medical attention if child experiences any signs or symptoms of complications such as fever, purulent nasal discharge, epistaxis, facial pain and/or swelling
• referral to ENT as per local practice any child with significant complications following foreign body removal

**Disclaimer**

This guideline is intended as a guide and provided for information purposes only. The information has been prepared using a multidisciplinary approach with reference to the best information and evidence available at the time of preparation. No assurance is given that the information is entirely complete, current, or accurate in every respect. We recommend hospitals follow their usual practice for endorsement locally including presenting it to their local Medicines Advisory Committee (or equivalent) prior to use.

The guideline is not a substitute for clinical judgement, knowledge and expertise, or medical advice. Variation from the guideline, taking into account individual circumstances may be appropriate.

This guideline does not address all elements of standard practice and accepts that individual clinicians are responsible for:

- Providing care within the context of locally available resources, expertise, and scope of practice
- Supporting consumer rights and informed decision making in partnership with healthcare practitioners including the right to decline intervention or ongoing management
- Advising consumers of their choices in an environment that is culturally appropriate and which enables comfortable and confidential discussion. This includes the use of interpreter services where necessary
- Ensuring informed consent is obtained prior to delivering care
- Meeting all legislative requirements and professional standards
- Applying standard precautions, and additional precautions as necessary, when delivering care
- Documenting all care in accordance with mandatory and local requirements

Children’s Health Queensland disclaims, to the maximum extent permitted by law, all responsibility and all liability (including without limitation, liability in negligence) for all expenses, losses, damages and costs incurred for any reason associated with the use of this guideline, including the materials within or referred to throughout this document being in any way inaccurate, out of context, incomplete or unavailable.
Child presents to ED with foreign body in nose

Button battery suspected?

Yes

Urgent removal required to prevent tissue necrosis

- Keep NBM
- Targeted facial X-ray if cannot be directly visualised (contact RSQ to arrange transfer for X-ray if no on-site X-ray)

No

Removal not urgent

Criteria for ENT referral? (Box A)

No

Single attempt at removal (see Guideline for possible methods)

Yes

Successfully removed and no significant trauma?

Yes

Discharge home with advice re potential complications & accident prevention

Refer to ENT service.

No

Urgent referral to ENT (onsite or via Retrieval Services Queensland (RSQ))

Box A: Criteria for ENT referral
Refer a child with the following foreign bodies to ENT (do not attempt removal in ED):
- posterior and not easily visualised
- paired magnets or magnet and metallic object across nasal septum
- chronic or impacted with marked inflammation
- penetrating or hooked
- remain despite multiple attempts at removal prior to ED presentation

Consider seeking senior emergency/ENT advice as per local practices

Refer to onsite/local ENT as per local practices.

Refer to ENT (onsite or via Retrieval Services Queensland (RSQ) on 1300 799 127) for urgent removal
